

REQUEST FOR BIDS
ASBESTOS PROJECT DESIGN, AIR MONITORING & ABATEMENT
ITB #16-25/26
January 9, 2026

BACKGROUND:

Sumter County and the City of Sumter have received a grant from the U.S. Department of Housing and Urban Development to demolish privately owned vacant, dilapidated houses.

The County and City are requesting bids from SCDHEC-licensed firms to abate the asbestos contained in these structures in accordance with all SCDHEC regulations

SCOPE OF WORK:

ABATEMENT PLAN (PROJECT DESIGN)

The “Asbestos Project Design” shall be a written plan prepared by a certified asbestos project designer specifying how the asbestos abatement project will be performed (for each house) including, but not limited to, a scope of work and technical specifications. The project design must comply with 40 CFR 763.90 (9) Federal Register and SCDHEC regulations. The scope of work of this project design shall, at a minimum, address the following:

- Preparation of each asbestos-related work area
- Establishment of each containment
- Establishment of each decontamination unit and procedures for use
- Evaluation and selection of various fiber release control options
- Establishment, maintenance, and monitoring of negative air pressure within each containment
- Regulated Asbestos Containing Material (RACM) enclosure, removal, encapsulation, or repair work practices
- Visual inspection procedures for each asbestos abatement containment area
- Clean-up and final clearance procedures
- Air monitoring, including analysis documentation, and any other required record keeping
- Respiratory protection and personal protective equipment requirements
- Procedures for on-site storage, handling, and disposal of Asbestos-Containing Materials (ACM) and project waste
- Procedures for maintaining personnel licenses and training certificates on-site

The project designer shall be on SCDHEC’s Asbestos Hazard Emergency Response Act (AHERA) Certified list of Project Designers. *Documentation of such certification shall be included with the submission of the quote.*

AIR MONITORING:

This request for bids also includes the procurement of air monitoring services to be provided by SCDHEC certified and licensed Asbestos Air Samplers to perform air sampling in accordance with SCDHEC Regulation #61-86.1 during asbestos abatement activities at each project site. This includes a visual clearance and Transmission Electron Microscopy (TEM) clearance with a possible variance for Phase Contrast Microscopy (PCM) monitoring since the

structures are to be demolished. The quotes shall be based on a per day rate assuming a 40-hour week and no work on weekends.

SCDHEC licensed asbestos firms interested in bidding on the Asbestos Assessment, Project Design and Air Monitoring Request should return:

ABATEMENT:

Remove and properly dispose of all asbestos containing materials per SCDHEC regulations. (Abatement by demolition, if indicated, per SCDHEC guidelines.)

Mail or Overnight Sealed Bids:

John Macloskie C/O Tony Butts
City of Sumter
12 W. Liberty Street
Sumter, SC 29150

Hand Deliver Sealed Bids:

Tony Butts
City of Sumter Opera House (BACK ENTRANCE)
21 N. Main Street (8:30 am – 4:30 pm)
Sumter, SC 29150

BIDS:

Bids are due no later than Thursday, February 12, 2026 at 2:00 PM

Bids will be opened on Thursday, February 12, 2026 at 2:00 PM., at the **City of Sumter Liberty Center, 12 W. Liberty S St., Sumter, SC.** A tabulation of offers (bid tab) will be made available for public record.

The lowest responsible and responsive bid will be selected. In the event of a tie bid, Sumter County procurement policy procedures shall prevail. Sumter County reserves the right to reject any or all bids. Sumter County reserves the right to waive all informalities not involving price, time, or changes in the work and to negotiate contract terms with the successful bidder.

Attach licenses/certification (documentation) for staff that will complete the work.

VENDOR AGREEMENTS – FORMAL INVITATIONS-TO-BID

Submittal of Sealed (Formal) Bids On the date set and at the time designated for the opening of the sealed bid, each prospective bidder is required to submit the bid deposit in the amount and form specified herein. Outside of envelope containing the **sealed** bid must be clearly marked: **Invitation-to Bid # 16-25/26, ASBESTOS PROJECT DESIGN, AIR MONITORING & ABATEMENT**. Each prospective bidder is required to complete and execute the bid form attached in this Invitation to Bid, and all information and certifications called for thereon must be furnished. Bids submitted in any other manner or which fail to furnish all information or certifications required may be summarily rejected. Bids shall be filled out legibly with all erasures, strikeovers, and corrections initialed by the person signing the bid and the bid must be manually signed. Negligence on the part of the bidder in preparing the bid confers no right for withdrawal or modification of the bid.

City of Sumter reserves the right to obtain clarification or additional information necessary to properly evaluate a bid. Failure of vendor to respond to a request for additional information or clarification could result in rejection of that vendor's bid. City of Sumter reserves the right to accept or reject any and all bids, in whole or in part, separately or together, with or without cause; to waive technicalities in submissions, to secure a project that is deemed to be in the best interest of the City. City of Sumter also reserves the right to make purchases outside of the awarded contracts where it is deemed in the best interest of the City.

Each responder, by submitting a bid to the City of Sumter a result of this Invitation-to-Bid, agrees to and acknowledges its acceptance of and agreement with the procedures outlined herein and all terms, conditions and requirements of the applicable City of Sumter Bid documents. If a vendor cannot agree to these terms, or violates these procedures, the response will be judged non-responsive and not considered. If the procedures are violated during the evaluation process or prior to the issuance of a contract by the City of Sumter, the offer of the firm in question will be void and City of Sumter will procure the goods/services in question from other eligible vendors.

At the time of the opening of bids, each responder will be presumed to have read and to be thoroughly familiar with the Documents (including all addenda). The failure or omission of any responder to examine any form, instruction or document shall in no way relieve any responder from any obligation in respect to this Invitation-to-Bid.

Responses submitted are final and complete offers by the vendor. No additions, corrections, modifications, changes or interpretations will be allowed. In the event questions arise on what is meant by an offer, the Purchasing Manager will make a determination as to the city's interpretation of the vendor's offer. If, after informing the vendor of the city's opinion, disagreement as to scope of the offer is present, the offer will be declared VOID. City of Sumter reserves the right to award proposals received on the basis of individual items, groups of items, or the entire list of items; to reject any and all proposals; and to waive any technicalities. In every case, the City reserves the right to make awards deemed to be in the best interest of the City and to negotiate further the offer determined by the City to be in the best interest of the City. Unit prices will govern over extended prices. Prices must be stated per unit and extended for the total quantity. Sales, use, or excise tax, as well as any handling and shipping charges, must be shown as separate items. The Owner reserves the right to increase or decrease the amount of work under the Contract at the unit prices quoted in the bid received from the successful responder.

Responders must clearly mark as "Confidential" each part of their offer which they consider proprietary information that could be exempt from disclosure under Section 30-4-40, Code of Laws of South Carolina, 1976 as amended (Freedom of Information Act). If any part is designated as "confidential", there must be attached to that part an explanation of how this information fits within one or more categories listed in Section 30-4-40.

City of Sumter reserves the right to determine whether this information should be exempt from disclosure and no legal action may be brought against City of Sumter or its agents for its determination in this regard. Should any responder fail to perform or comply with any provision or terms and conditions of any documents referenced and made part hereof, City of Sumter may terminate this contract, in whole or in part, and may consider such failure or non compliance a breach/default of contract.

The City reserves the right to purchase any/all items or service in default on the open market. No additional responses will be considered from a firm in default until the default expenses are paid. No principals of a defaulting firm may submit a response under another organization or individual name until their previous default is settled.

RIGHT TO INCREASE OR DECREASE THE AMOUNT OF WORK: The Owner reserves the right to increase or decrease the amount of work under the Contract at the unit prices quoted in the bid received from the successful responder.

INSURANCE REQUIREMENTS:

The Responder agrees to secure at Responder's own expense all personnel necessary to carry out Responder's obligations under this Bid. Such personnel shall not be deemed to be employees of the City nor shall they or any of them have or is deemed to have any direct contractual relationship with the City. The City shall not be responsible for withholding taxes with respect to the Responder's compensation hereunder. Responder shall not hold himself out as an employee of the City, and shall have no power or authority to bind or obligate the City in any manner, except the City shall make payment to Responder for services as herein provided. Responder shall obtain and maintain all licenses and permits required by law for performance of this contract by him. The Responder shall have no claim against the City hereunder or otherwise for vacation pay, sick leave, retirement benefits, social security, worker's compensation, health or disability benefits, unemployment insurance benefits, or employee benefits of any kind, State or Federal governments' benefits, including but not limited to Social Security, workmen's compensation, Employment Security, sales or use tax and any other taxes and licenses or insurance premiums required by law. The City shall pay no employee benefits or insurance premiums of any kind to or for the benefit of Responder or his employees, agents, and servants by reason of this contract. The Responder will carry liability insurance relative to any service that he performs for the City. A certificate of insurance must be submitted to the purchasing office prior to services performed, with the requested coverage and limits per the City, with City of Sumter listed as additional insured.

1. Contractor's and Subcontractor's Insurance: Before commencing the Work, and until completion and final acceptance of the Work, the Contractor shall procure and maintain, at its own expense, the insurance coverages described below. Before starting the Work, Contractor shall furnish a Certificate of Insurance, in a form acceptable to Owner, evidencing the Contractor's compliance with the Agreement's insurance requirements. All insurance policies are to be written through a company duly authorized to transact that class of insurance within the jurisdiction of the Project site and shall be with insurance companies acceptable to Owner and with A.M. Best Rating of A minus or better. The Certificates and policies for the Commercial General Liability and Business Automobile Liability Policy shall name Owner, and if requested, Owner's agents, as Additional Insureds for completed and ongoing operations on a primary and non-contributory basis. All Insurance Certificates shall state policy numbers, dates of expiration, policy limits, and provide that the insurance will not be cancelled or changed unless Owner has been given written notice at least thirty (30) days prior to the date of the proposed change or cancellation.

If the Contractor fails to procure or maintain required insurance coverages, Owner shall have the right, but not the obligation, to procure and maintain the required insurance for and in the name of the Contractor, and Contractor shall pay the cost thereof and furnish all necessary information to make effective and maintain such insurance. Contractor shall not commence work until all insurance requirements are met.

a. Required Insurance Coverages: The insurance coverages to be provided include those as set forth below unless modified in an Insurance Exhibit attached to the Agreement:

(1) Commercial General Liability Insurance with limits of \$1,000,000.00 per occurrence/\$1,000,000 aggregate Bodily Injury and Property Damage Liability. This coverage must, at a minimum, include coverage and/or endorsements for premises operations, products/completed operations, contractual liability assumed by Contractor under this Agreement, personal injury, advertising injury and broad form Property Damage (including coverage for explosion, collapse and underground hazards), and independent Contractor coverages. All liability policies must be written on an "occurrence" basis. Such policy shall not contain Endorsement, CG 22 94 10 01. The Commercial General Liability and Automobile Liability insurance required herein shall protect the Contractor and the Owner against liability from damages growing out of any Contractor operations (including the operation of all automobiles, trucks, and other vehicles owned or rented) in connection with the performance of this Agreement, as well as liability arising after the completion of the Contractor's operations.

(2) Motor Vehicle Liability Insurance with bodily injury limits of \$1,000,000.00 and property damage limits of \$1,000,000.00 or a combined single limit of \$1,000,000.00.

(3) Worker's Compensation in accordance with, and providing coverages meeting or exceeding the limits required by, the laws of the State of South Carolina jurisdiction, and Employer's Liability Insurance with the following minimum limits: \$100,000 Per Accident, \$100,000 Per Disease for Each Employee, \$500,000 aggregate.

(4) Excess or Umbrella Liability Insurance with a policy limit of \$1,000,000.00 per occurrence and aggregate.

(5) Sub-Contractor Insurance: If Contractor elects, with Owner's approval, to subcontract any portion of the Work to another Contractor, Contractor shall require of such Subcontractor insurance coverage similar to that required of Contractor hereunder and shall furnish to Owner evidence that such insurance coverages are currently in effect. Moreover, Contractor shall require any such Subcontractor to name Contractor and Owner as additional insured's on Subcontractor's Commercial General Liability Insurance and will provide Contractor with a waiver of subrogation form from such sub-Contractors worker's compensation carrier. Failure of Contractor to require Subcontractor to obtain the coverages required herein or to furnish Owner evidence of such coverage shall be grounds for termination for default.

b. The Contractor shall furnish one copy of each Certificate of Insurance herein required attached to each copy of the Agreement, plus three additional copies of each Certificate of Insurance herein required, which shall specifically set forth evidence of all coverages set forth above. The Contractor shall furnish to the Owner copies of any endorsements that are subsequently issued amending coverage or limits.

2. Payment and Performance Bonds (CONSTRUCTION BIDS ONLY): If the Contractor's work as set forth in the Scope of Work exceeds \$50,000.00, Contractor shall provide payment and performance bonds in the full amount of the Contract Sum.

a. The payment and performance bonds, if any, shall name Owner as the obligee. Such bonds must be secured by cash or must be issued by a surety company licensed in the State of South Carolina with an "A" minimum rating of performance as stated in the most current publication of "Best Key Rating Guide, Property Liability".

b. Upon execution of the Contract Documents, the Contractor shall furnish to the Owner a Performance Bond and a separate Labor and Material Payment Bond in a form acceptable to the Owner.

The bonds shall guarantee the Contractor's faithful performance of the Contract and payment of all obligations arising thereunder. The bonds shall remain in force until the Work has been completed and accepted by the Owner, the provisions of all guarantees required by these Contract Documents have been fulfilled, and the warranty periods and period for correction of the Work as provided in the Contract Documents have expired, or the period for filing mechanics' liens has expired, whichever occur latest, after which time the bonds shall lapse. The Contractor shall bear all costs in connection with the bonds as a part of the Contract. One executed copy of each bond shall be attached to each executed copy of the Contract Documents prior to the execution of the Contract Documents by the Owner.

c. The Contractor shall require the attorney-in-fact who executes the required bonds on behalf of the surety to affix thereto a certified and current copy of the power of attorney.

All items delivered to or drop shipped to the site remain the sole responsibility of the Bidder. Bidder is solely responsible for maintaining insurance on and replacing said items in the event of theft, damage, or other loss.

Each of the bidders shall fully familiarize itself with the conditions relating to the bid to insure complete understanding of all the details involved. The bidder shall satisfy itself as to the actual requirements of the bid by personal examination of its location or other means, so as to enable the bidder to make an informed bid. Failure to do so shall not relieve the successful bidder of its obligation to furnish all materials, products, and/or labor necessary to complete the provision of the awarded contract and failure to do so may result in the claims against bonds. No allowance will be made for any claims that a bid and/or response was based on incomplete information as to the nature and character of the sites and of the work involved.

The responder shall indemnify, defend and hold harmless City of Sumter, its officers, agents and employees from liability and any claims, suits, judgments, and damages of any nature brought because of, arising out of, or due to breach of the agreement by Responder, its subcontractors, suppliers, agents, or employees or due to any negligent act or occurrence or any omission or commission of Responder, its subcontractors, suppliers, agents, or employees.

Should any responder fail to perform or comply with any provision or terms and conditions of any documents referenced and made part hereof, City of Sumter may terminate this contract, in whole or in part, and may consider such failure or non compliance a breach/default of contract. The City reserves the right to purchase any/all items or service in default on the open market. By submittal of a response, all responders agree to this provision. No additional responses will be considered from a firm in default. No principals of a defaulting firm may submit a response under another organization or individual name until their previous default is settled.

City of Sumter may terminate this agreement with or without cause at anytime. In the event of termination by either party, uncontested fees due for services satisfactorily performed or goods accepted prior to the termination shall be paid.

FEDERAL FUNDING CONTRACT/AGREEMENT
FEDERAL AGENCY'S GRANT PROGRAM
REQUIREMENTS FOR PROCUREMENT CONTRACTS

Contractual Certifications and Assurances

2 CFR Part 200 UNIFORM ADMINISTRATIVE REQUIREMENTS,
COST PRINCIPLES, AND AUDIT REQUIREMENTS FOR FEDERAL AWARDS

WHEREAS, this Contract/Agreement between _____
("Contractor"), and City of Sumter, (the "City") for ITB #16-25/26.

WHEREAS, the City issued ITB #16-25/26 which is hereby incorporated into this Contract/Agreement in its entirety by reference;

NOTWITHSTANDING, the date of execution of this Contract/Agreement by the parties hereto, the parties intend that this Contract/Agreement shall be effective as of Date of Original Purchase Order;

WHEREAS, the parties acknowledge that the above-referenced Contract/Agreement is subject to the provisions of 2 C.F.R. § 200 Uniform Administrative Requirements, Cost Principles and Audit Requirements for Federal Awards and the Robert T. Stafford Disaster Relief and Emergency Assistance Act (42 U.S.C. 5121-5207 et seq.);

WHEREAS, this Contract/Agreement is hereby expressly incorporated into the Contract/Agreement between the City of Sumter and the Contractor. The Contractor agrees to include the above clause in each third party subcontract financed in whole or in part with Federal assistance provided by HUD. It is further agreed that the clause shall not be modified, except to identify the subcontractor who will be subject to its provisions. To the extent that the terms of the ITB #16-25/26 and if this Contract/Agreement conflict, the terms of this Contract/Agreement shall control;

The following provisions are hereby added and incorporated into the above-referenced Contract/Agreement:

- I. TERMINATION FOR CONVENIENCE OF THE CITY** (*applicable to all contracts in excess of \$10,000*)
- A. City shall have the option, in its sole discretion, to terminate this Contract/Agreement, at any time during the term hereof, for convenience and without cause. City shall exercise this option by giving Contractor written notice of termination. The notice shall specify the date on which termination shall become effective.
 - B. Upon receipt of the notice, Contractor shall commence and perform, with diligence, all actions necessary on the part of Contractor to effect the termination of this Contract/Agreement on the date specified by City and to minimize the liability of Contractor and City to third parties as a result of termination. All such actions shall be subject to the prior approval of the City. Such actions shall include, without limitation:

1. Halting the performance of all services and other work under this Contract/Agreement on the date(s) and in the manner specified by City.
 2. Not placing any further orders or subcontracts for materials, services, equipment or other items.
 3. Terminating all existing orders and subcontracts.
 4. At City's direction, assigning to City any or all of Contractor's right, title, and interest under the orders and subcontracts terminated. Upon such assignment, City shall have the right, in its sole discretion, to settle or pay any or all claims arising out of the termination of such orders and subcontracts.
 5. Subject to City's approval, settling all outstanding liabilities and all claims arising out of the termination of orders and subcontracts.
 6. Completing performance of any services or work that City designates to be completed prior to the date of termination specified by City.
 7. Taking such action as may be necessary, or as the City may direct, for the protection and preservation of any property related to this Contract/Agreement which is in the possession of Contractor and in which City has or may acquire an interest
- C. Within 30 days after the specified termination date, Contractor shall submit to City an invoice, which shall set forth each of the following as a separate line item:
1. The reasonable cost to Contractor, without profit, for all services and other work City directed Contractor to perform prior to the specified termination date, for which services or work City has not already tendered payment. Reasonable costs may include a reasonable allowance for actual overhead, not to exceed a total of 10% of Contractor's direct costs for services or other work. Any overhead allowance shall be separately itemized. Contractor may also recover the reasonable cost of preparing the invoice. Taking such action as may be necessary, or as the City may direct, for the protection and preservation of any property related to this Contract/Agreement which is in the possession of Contractor and in which City has or may acquire an interest.
 2. A reasonable allowance for profit on the cost of the services and other work described in the immediately preceding subsection (1), provided that Contractor can establish, to the satisfaction of City, that Contractor would have made a profit had all services and other work under this Contract/Agreement been completed, and provided further, that the profit allowed shall in no event exceed 5% of such cost.
 3. The reasonable cost to Contractor of handling material or equipment returned to vendor, delivered to the City or otherwise disposed of as directed by the City.
- D. In no event shall City be liable for costs incurred by Contractor or any of its subcontractors after the termination date specified by City, except for those costs specifically enumerated and described in the immediately preceding subsection C. Such non-recoverable costs include, but are not limited to, anticipated profits on this Contract/Agreement, post-termination employee salaries, post-termination administrative expenses, post-termination overhead or unabsorbed overhead, attorneys' fees or other costs related to the prosecution of a

claim or lawsuit, prejudgment interest, or any other expense which is not reasonable or authorized under such subsection C.

E. In arriving at the amount due to Contractor under this Section, City may deduct:

1. All payments previously made by City for work or other services covered by Contractor's final invoice;
2. Any claim which City may have against Contractor in connection with this Contract/Agreement;
3. Any invoiced costs or expenses excluded pursuant to the immediately preceding subsection D; and
4. In instances in which, in the opinion of the City, the cost of any service or other work performed under this Contract/Agreement is excessively high due to costs incurred to remedy or replace defective or rejected services or other work, the difference between the invoiced amount and City's estimate of the reasonable cost of performing the invoiced services or other work in compliance with the requirements of this Contract/Agreement.

F. City's payment obligation under this Section shall survive termination of this Contract/Agreement.

II. TERMINATION FOR DEFAULT – REMEDIES FOR BREACH *(applicable to contracts in excess of the simplified purchase threshold (\$150,000.00) shall contain provisions allowing for administrative, contractual, or legal remedies for contractor breaches of the contract terms, and shall provide for such remedial actions as appropriate)*

Contractor's failure to perform or observe any term, covenant or condition of this document (Federal Emergency Management Agency's Emergency Management Performance Grant Program Requirements for Procurement Contracts) shall constitute an event of default under this Contract/Agreement.

A. Each of the following shall also constitute an event of default ("Event of Default") under this Contract/Agreement:

1. Contractor fails or refuses to perform or observe any other term, covenant or condition contained in this Contract/Agreement, and such default continues for a period of ten days after written notice thereof from City to Contractor.

2. Contractor (a) is generally not paying its debts as they become due, (b) files, or consents by answer or otherwise to the filing against it of a petition for relief or reorganization or arrangement or any other petition in bankruptcy or for liquidation or to take advantage of any bankruptcy, insolvency or other debtors' relief law of any jurisdiction, (c) makes an assignment for the benefit of its creditors, (d) consents to the appointment of a custodian, receiver, trustee or other officer with similar powers of Contractor or of any substantial part of Contractor's property or (e) takes action for the purpose of any of the foregoing.

3. A court or government authority enters an order (a) appointing a custodian, receiver, trustee or other officer with similar powers with respect to Contractor or with respect to any substantial part of Contractor's property, (b) constituting an order for relief or approving a petition for relief or reorganization or arrangement or any other petition in bankruptcy or for liquidation or to take advantage

of any bankruptcy, insolvency or other debtors' relief law of any jurisdiction or (c) ordering the dissolution, winding-up or liquidation of Contractor.

B. On and after any Event of Default, City shall have the right to exercise its legal and equitable remedies, including, without limitation, the right to terminate this Contract/Agreement or to seek specific performance of all or any part of this Contract/Agreement. In addition, City shall have the right (but no obligation) to cure (or cause to be cured) on behalf of Contractor any Event of Default; Contractor shall pay to City on demand all costs and expenses incurred by City in effecting such cure, with interest thereon from the date of incurrence at the maximum rate then permitted by law. City shall have the right to offset from any amounts due to Contractor under this Contract/Agreement or any other Contract/Agreement between City and Contractor all damages, losses, costs or expenses incurred by City as a result of such Event of Default and any liquidated damages due from Contractor pursuant to the terms of this Contract/Agreement or any other agreement.

C. All remedies provided for in this Contract/Agreement may be exercised individually or in combination with any other remedy available hereunder or under applicable laws, rules and regulations. The exercise of any remedy shall not preclude or in any way be deemed to waive any other remedy

III. SOCIO-ECONOMIC ENGAGEMENT

Contractor will take the following affirmative steps to engage small and minority firms, women's business enterprises, and labor surplus area firms.

A. Place qualified small and minority business and women's business enterprises on sub-contractor solicitation lists.

B. Assure that such firms are solicited whenever they are potential sources.

C. Divide total requirements into smaller tasks or quantities to permit maximum participation by such firms.

D. Establish delivery schedules which encourage participation by such firms.

IV. ACCESS TO RECORDS

A. Contractor agrees to provide the City, HUD, the Comptroller General of the United States or any their authorized representatives access to any books, documents, papers, and records of the Contractor which are directly pertinent to this *Contract/Agreement* for the purposes of making audits, examinations, excerpts and transcriptions.

B. Contractor agrees to permit any of the foregoing parties to reproduce by any means whatsoever or to copy excerpts and transcriptions as reasonably needed.

C. Contractor agrees to maintain all books, records, accounts and reports required under this *Contract/Agreement* for a period of not less than three years after the later of: (a) the date of termination or expiration of this Contract/Agreement or (b) the date City makes final payment under this Contract/Agreement, except in the event of litigation or settlement of claims arising from the performance of this Contract/Agreement, in which case, Contractor agrees to maintain same until the City, HUD, the Comptroller General, or any of their duly authorized representatives, have disposed of all such litigation, appeals, claims or exceptions related thereto.

V. EQUAL EMPLOYMENT OPPORTUNITY *(applicable to all construction contracts awarded in excess of \$10,000 by grantees and their contractors or sub-grantees)*

Contractor agrees to comply with Executive Order 11246, "Equal Employment Opportunity," as amended by Executive Order 11375, "Amending Executive Order 11236 Relating to Equal Employment Opportunity," and as supplemented by regulations at 41 CFR part 60, "Office of Federal Contract Compliance Programs, Equal Employment Opportunity, Department of Labor.

VI. COPELAND "ANTI-KICKBACK" ACT *(applicable to all contracts and subgrants for construction or repair)*

Contractor agrees to comply with the Copeland "Anti-Kickback" regulations under Section 2 of the Act of June 13, 1934, as amended (40 U.S.C. 276c), popularly known as the Copeland Act. (18 U.S.C. 874) as supplemented in Department of Labor regulations (29 CFR Part 3).

A. Subcontracts. Contractor or subcontractor shall insert in any subcontracts the clause above and such other clauses as the HUD may by appropriate instructions require, and also a clause requiring the subcontractors to include these clauses in any lower tier subcontracts. The prime contractor shall be responsible for the compliance by any subcontractor or lower tier subcontractor with all of these contract clauses.

B. Breach. A breach of the Contract/Agreement clauses above may be grounds for termination of the Contract/Agreement, and for debarment as a contractor and subcontractor as provided in 29 C.F.R. § 5.12.

VII. CONTRACT WORK HOURS AND SAFETY STANDARDS ACT *(applicable to all construction contracts awarded by grantees and sub-grantees in excess of \$2,000, and all other contracts involving the employment of mechanics or laborers in excess of \$2,500)*

Contractor agrees that it shall comply with Sections 103 and 107 of the Contract/Agreement Work Hours and Safety Standards Act (40 U.S.C. 327–330) as supplemented by Department of Labor regulations (29 CFR Part 5), which requires each contractor to compute the wages of every mechanic and laborer on the basis of a standard work week of 40 hours. Work in excess of the standard work week is permissible provided that the worker is compensated at a rate of not less than one and one-half times the basic rate of pay for all hours worked in excess of 40 hours. Section 107 is applicable to construction work and provides that no laborer or mechanic shall be required to work in surroundings or under working conditions that are unsanitary, hazardous, or dangerous.

VIII. CLEAN AIR ACT AND FEDERAL WATER POLLUTION CONTROL ACT *(applicable to all contracts and subcontracts in excess \$100,000, including indefinite quantities where the amount is expected to exceed \$100,000 in any year)*

- A. Contractor agrees to comply with all applicable standards, orders, or requirements issued under section 306 of the Clean Air Act (42 U.S.C. 1857(h)), section 508 of the Clean Water Act (33 U.S.C. 1368), Executive Order 11738, and Environmental Protection Agency regulations (40 CFR Part 15).
- B. Contractor acknowledges that the Clean Air Act (CAA) is the comprehensive federal law regulating air emissions from stationary and mobile sources. Among other things, this law authorizes EPA to establish National Ambient Air Quality Standards (NAAQS) to protect public health and public welfare and to regulate emissions of hazardous air pollutants.
- C. Contractor acknowledges that the Federal Water Pollution Control Act, popularly known as the Clean Water Act, is a comprehensive law aimed at restoring and maintaining the chemical,

physical and biological integrity of the nation's waters. The Act authorizes water quality programs, requires federal effluent limitations and state water quality standards, requires permits for the discharge of pollutants into navigable waters, provides enforcement mechanisms, and authorizes funding for wastewater treatment construction grants and state revolving loan programs, as well as funding to states and tribes for their water quality programs.

- D. Contractor agrees to report each violation of these requirements to the City and understands and agrees that the City will, in turn, report each violation as required to assure notification to HUD and the appropriate EPA regional office.
- E. Contractor agrees to include paragraph a) and d) above in each third party subcontract exceeding \$100,000 financed in whole or in part with Federal assistance provided by HUD.

IX. BYRD ANTI-LOBBYING AMENDMENT

Contractor acknowledges and agrees that Sub-recipients applying or bidding for an award of \$100,000 or more shall certify that they have not used Federal appropriated funds to pay any person or organization for influencing or attempting to influence an officer or employee of any agency, a member of Congress, officer or employee of Congress, or any employee of a member of Congress in connections with obtaining any Federal contract, grant, or any other award covered by 31 U.S.C. §1352.

X. DEBARMENT AND SUSPENSION

Contractor certifies that neither it nor its Principals (as defined at 49 C.F.R. §29.105) or any of its subcontractors is presently debarred, suspended, proposed for debarment, declared ineligible, or voluntarily excluded from participation in this Contract/Agreement by any Federal department or agency.

Except as modified herein, all terms and conditions of the existing Contract/Agreement between the parties remain in full force and effect.

FOREWORD

This report was prepared by Emerald, Inc. of Sumter, South Carolina, for the City of Sumter, regarding the vacant commercial building located at 12 Kelly Ave. in Sumter, S.C. The contents of this report are confidential and intended for the use of the client only.

J. Dalton Reames, Jr., S.C. Licensed Building Inspector, conducted the inspection, and Ronny L. Lowder, S.C. Licensed Building Inspector and Management Planner, prepared this report. Any questions or comments concerning this report should be directed to Ronny L. Lowder at either (803) 469-5454 or via email at rlowder@emeraldinc-us.com.

1.0 INTRODUCTION AND OBJECTIVE

Emerald, Inc. was requested to conduct an Asbestos Survey of the vacant commercial structure located at 12 Kelly Ave. in Sumter, S.C., to identify the presence of any asbestos-containing materials (ACM), prior to demolition activities. The inspection was authorized by Mr. John Macloskie, Codes Director, with the City of Sumter. The inspection included identification and assessment of the condition of suspect asbestos-containing materials, either friable or non-friable, on the interior and exterior portions of the structure.

This report is a compilation of the inspection and its results.

2.0 SURVEY METHODOLOGY

On November 14, 2024, Emerald, Inc. conducted an Asbestos Survey on the building at the stated address. J. Dalton Reames, Jr., South Carolina Licensed Building Inspector, conducted the inspection.

With original construction dating to the 1950's, as well as subsequent additions and improvements, the single-story commercial structure contains approximately 800 total square feet of interior space and was most recently utilized for office and business purposes. A wood-framed building section and a concrete masonry unit (CMU) section comprise the structure. The basic construction of each section is as follows:

- Wood-framed Office Section (Approximately 35' x 20')
 - Wood Floor Substrate Built Over Bare Earth
 - 9x9 Floor Tile in Area B (See Appendix A, Site Plan)
 - Uncovered Wood in Area A
 - Interior Walls
 - Some Paneling over Gypsum in Area B

- Uncovered Wood Framework
 - Wooden, A-framed Roof Structure Serves as Ceiling
- CMU Restroom Section (Approximately 10' x 10')
 - Uncovered Concrete Slab Floors
 - Uncovered CMU Interior Walls
 - Roof and Ceiling Are Homogeneous with the Office Section

No climate control equipment was present in either building section.

Future use of the property, following demolition activities, is unknown.

The survey included a visual inspection to identify the presence of material suspected of containing asbestos. This identification was based on the experience and training of the inspector. A total of twenty-one (21) samples were collected during the survey for laboratory analysis, based upon the required EPA and South Carolina Department of Environmental Services (SCDES) sampling matrix. Samples were placed in individual containers, labeled and numbered according to the sampling schemes (12-1 through 12-21). Per SCDES Asbestos Regulations, the independent laboratory is required to sample all layers of each sample. As a result, fourteen (14) samples were analyzed by the lab, via Polarized Light Microscopy (PLM) while utilizing Positive Stop, and five (5) samples were analyzed, via Transmission Electron Microscopy (TEM). Appendix B contains the Asbestos Survey Log kept during the inspection which identifies the samples collected by sample number, sample type, location and condition assessment, along with any comments. The samples were shipped to EMSL Analytical, Inc. in Kernersville, North Carolina for analysis. Analysis and results are discussed in Section 4.0.

3.0 HAZARD ASSESSMENT FACTORS (ASBESTOS)

3.1 Homogeneous Areas

The sample collection was typically conducted by homogeneous materials, i.e., any materials of the same type regarding uniformity throughout in structure or make-up and appearance (color, texture, and/or date of construction/application). Homogeneous materials can be further classified as surfacing materials, thermal system insulation and miscellaneous materials. Miscellaneous materials include ceiling tiles, floor tiles, roofing, caulking, and glazing, etc.

3.2 Hazard Factors

The samples of suspect material collected were classified as either friable (F) or non-friable (NF). Friable means the material can be crumbled, pulverized, or reduced to powder by ordinary hand pressure. Materials initially determined to be non-friable can receive a reclassification of friable if the material is damaged, thereby providing an avenue for release of asbestos fibers. Friable asbestos-containing material (ACM) has been determined by EPA and OSHA to be a greater hazard (health risk) than non-friable ACM. In assessing the fiber release potential, the current condition of the suspect materials sampled was noted in the Asbestos Survey Log (Appendix B). The condition was denoted as good, damaged, or significantly damaged. Current condition is a factor used to assess the potential for fiber release. Other factors used to determine potential fiber release include air movement, surface type, and area activity as related to human occupancy.

4.0 ANALYSIS AND RESULTS

4.1 Laboratory Analysis

Bulk samples were analyzed by EMSL Analytical, Inc. using Polarized Light Microscopy (PLM) with Dispersion Staining Techniques (EPA Bulk Analysis Method 600/R-93/116). This method utilizes part of the bulk sample which is mounted on a slide and exposed to an oil of specific refractive index. This prepared slide is then subjected to a variety of optical tests.

Each type of asbestos displays unique characteristics when subjected to these tests. Percentages of asbestos content are then determined through visual estimating. Although this is an estimate, any material containing greater than one percent of any type of asbestos is classified as ACM by the EPA. Any material classified as ACM must be handled accordingly.

Under the revised South Carolina Asbestos Regulation 61-86.1 effective June 27, 2008, any analysis of non-friable organically bound (NOB) material that is found to be negative via PLM testing, must have confirmation testing via Transmission Electron Microscopy (TEM) on one sample from each media; therefore, five (5) samples were analyzed by the lab, via TEM testing.

4.2 Survey Results

Samples were collected and tested from various suspect materials, as referenced in Appendix B, Asbestos Sample Log. Samples of roof shingles, roofing felt, black floor tile mastic, window caulk and exterior wall felt were verified as negative, via TEM analysis.

Appendix C contains a copy of the analytical results from the laboratory.
of the analytical results from the laboratory.

TABLE 1
VACANT COMMERCIAL BUILDING
12 KELLY AVENUE
SUMTER, SOUTH CAROLINA
ASBESTOS-CONTAINING MATERIALS (ACM)

Description	Location	Category (F/NF)	Approx. SF/LF
Tan-colored 9x9 Floor Tiles	Over Wood Floor of Area B	Cat. I – NF – Good Condition	320 SF

Note: F - Friable
NF - Non-Friable

EMERALD, INC., CONDUCTED THE SURVEY TO THE BEST OF ITS ABILITY, ADHERING TO INDUSTRY STANDARDS. THE QUANTITIES PROVIDED IN THIS REPORT ARE APPROXIMATE AND SHALL SERVE AS A BASIS FOR ABATEMENT BID SUBMITTALS. IF ADDITIONAL SUSPECT MATERIALS ARE IDENTIFIED DURING RENOVATION OR DEMOLITION ACTIVITY, THE CONTRACTOR SHALL CEASE WORK AND NOTIFY THE BUILDING OWNER'S REPRESENTATIVE.

5.0 CONCLUSIONS AND RECOMMENDATIONS

Based upon the inspection of November 14, 2024, and the analytical results from the samples collected and tested by an independent laboratory, the vacant commercial building located at 12 Kelly Ave. in Sumter, S.C., does contain non-friable ACM, as per Table 1. Such materials will have to be removed and properly disposed by a S.C. licensed abatement contractor per SCDES Bureau of Air Quality Asbestos Regulation 61-86.1 effective May 27, 2011, prior to demolition activities involving the asbestos-containing materials.

6.0 ASSUMPTIONS AND LIMITATIONS

The results, findings, conclusions and recommendations expressed in this report are based only on conditions that were observed during the inspection of November 14, 2024. Emerald, Inc., their representative and this report make no representation and/or assumptions as to past conditions or future occurrences. The information, conclusions and recommendations provided herein do not constitute as legal or medical advice. It is further understood that Emerald, Inc. makes no representations or warranties of any kind. Nor are such representations or warranties to be implied with respect to the data furnished. Emerald, Inc. assumes no responsibility with respect to the customers and its employees use thereof.

The information provided herein applies only to the subject property as it existed during Emerald, Inc.'s site visit. If this site's use and/or conditions change, information, observations and recommendations found herein would no longer apply. This report is intended to be used in its entirety. No excerpts may be taken to typify the findings of this survey. Emerald, Inc. shall not be liable for any special, consequential and/or exemplary damages resulting, in whole or in part, from the customer's use of the data provided. It was not within the scope of this investigation to remove surface materials to investigate portions of the structure or materials that lay beneath the surface. Our selection of sample locations and frequency is based upon our observations and the assumption that like materials in the same are homogeneous.

Emerald, Inc. conducted the survey to the best of its ability using the standards of the industry. In the event additional materials are found to contain asbestos, Emerald, Inc. shall not be liable for any failure of such findings during its initial survey.

EMSL maintains liability limited to cost of analysis. Interpretation and use of test results are the responsibility of the client. This report relates only to the samples reported above, and may not be reproduced, except in full, without written approval by EMSL. EMSL bears no responsibility for sample collection activities or analytical method limitations. The report reflects the samples as received. Results are generated from the field sampling data (sampling volumes and areas, locations, etc.) provided by the client on the Chain of Custody. Samples are within quality control criteria and met method specifications unless otherwise noted. The above analyses were performed in general compliance with Appendix E to Subpart E of 40 CFR (previously EPA 600/M4-82-020 "Interim Method") but augmented with procedures outlined in the 1993 ("final") version of the method. This report must not be used by the client to claim product certification, approval, or endorsement by NVLAP, NIST or any agency of the federal government. Non-friable organically bound materials present a problem matrix and therefore EMSL recommends gravimetric reduction prior to analysis. Unless requested by the client, building materials manufactured with multiple layers (i.e. linoleum, wallboard, etc.) are reported as a single sample. Estimation of uncertainty is available on request.

FOREWORD

This report was prepared by Emerald, Inc., of Sumter, South Carolina, for the City of Sumter regarding the dilapidated residential building located at 22 Monroe St. in Sumter, S.C. The contents of this report are confidential and intended for the use of the client only.

J. Dalton Reames, Jr., S.C. Licensed Building Inspector, conducted the inspection and prepared this report. Any questions or comments concerning this report should be directed to Dalton Reames or Chad McClary, President, at either (803) 469-5454 or via email at dreames@emeraldinc-us.com or cmcclary@emeraldinc-us.com, respectively.

1.0 INTRODUCTION AND OBJECTIVE

Emerald, Inc. was requested to conduct an Asbestos Survey of the dilapidated residential building located at 22 Monroe St. in Sumter, S.C., to identify the presence of any asbestos-containing materials (ACM), prior to demolition activities. The inspection was authorized by Mr. John Macloskie, Codes Director, with the City of Sumter. The inspection included identification and assessment of the condition of suspect asbestos-containing materials, either friable or non-friable, on the interior and exterior portions of the structure.

This report is a compilation of the inspection and its results.

2.0 SURVEY METHODOLOGY

On October 22, 2025, Emerald, Inc. conducted an Asbestos Survey of the building at the stated location. J. Dalton Reames, Jr., South Carolina Licensed Building Inspector, conducted the inspection.

Constructed circa 1947 for residential purposes, the single-story structure has wood-framed exterior walls built over an earthen crawlspace and contains approximately 800 square feet of interior space. The basic building materials are as follows:

- Wood plank exterior walls attached to wood framework
- Wooden, A-framed roof structure covered with shingles and felt
- Wood floor substrate attached to wood joists
 - Resilient sheet floor layers
 - Tacked carpeting
- Interior Walls
 - Sheetrock with joint compound attached to wood framework
 - Wood paneling attached to wood framework

- Ceiling Materials
 - Sheetrock with joint compound attached to wood joists on interior areas
 - Stippled texture and paint over interior ceilings
 - Painted wood slats attached to wood joists on porch areas
- Climate control equipment was not observed

Future use of the property, following demolition activities, is unknown.

The survey included a visual inspection to identify the presence of materials suspected of containing asbestos. This identification was based on the experience and training of the inspector. A total of thirty-five (35) samples were collected during the survey for laboratory analysis, based upon the required EPA and South Carolina Department of Environmental Services (SCDES) sampling matrix. Samples were placed in individual containers, labeled and numbered according to the sampling scheme (22-1 through 22-35). Per SCDES Asbestos Regulations, the independent laboratory is required to analyze all layers of each sample. As a result of some sample materials containing multiple layers that were identified by the laboratory (e.g. sheetrock with joint compound and texture surface layers) thirty-nine (39) samples were analyzed by the lab, via Polarized Light Microscopy (PLM), and eight (8) samples were analyzed, via Transmission Electron Microscopy (TEM). Appendix B contains the Asbestos Survey Log kept during the inspection which identifies the samples collected by sample number, sample type, location and condition assessment, along with any comments. The samples were shipped to EMSL Analytical, Inc. in Kernersville, North Carolina for analysis. Analysis and results are discussed in Section 4.0.

3.0 HAZARD ASSESSMENT FACTORS (ASBESTOS)

3.1 Homogeneous Areas

The sample collection was typically conducted by homogeneous materials, i.e., any materials of the same type regarding uniformity throughout in structure or make-up and appearance (color, texture, and/or date of construction/application). Homogeneous materials can be further classified as surfacing materials, thermal system insulation and miscellaneous materials. Miscellaneous materials include ceiling tiles, floor tiles, roofing, caulking, and glazing, etc.

3.2 Hazard Factors

The samples of suspect material collected were classified as either friable (F) or non-friable (NF). Friable means the material can be crumbled, pulverized, or reduced to powder by ordinary hand pressure. Materials initially determined to be non-friable can receive a reclassification of friable if the material is damaged, thereby providing an avenue for release of asbestos fibers. Friable asbestos-containing material (ACM) has been determined by EPA and OSHA to be a greater hazard (health risk) than non-friable ACM. In assessing the fiber release potential, the current condition of the suspect materials sampled was noted in the Asbestos Survey Log (Appendix B). The condition was denoted as good, damaged, or significantly damaged. Current condition is a factor used to assess the potential for fiber release. Other factors used to determine potential fiber release include air movement, surface type, and area activity as related to human occupancy.

4.0 ANALYSIS AND RESULTS

4.1 Laboratory Analysis

Samples were analyzed by EMSL Analytical, Inc. using Polarized Light Microscopy (PLM) with Dispersion Staining Techniques (EPA Bulk Analysis Method 600/R-93/116). This method utilizes part of the bulk sample which is mounted on a slide and exposed to an oil of specific refractive index. This prepared slide is then subjected to a variety of optical tests.

Each type of asbestos displays unique characteristics when subjected to these tests. Percentages of asbestos content are then determined through visual estimating. Although this is an estimate, any material containing greater than one percent of any type of asbestos is classified as ACM by the EPA. Any material classified as ACM must be handled accordingly.

Under the revised South Carolina Asbestos Regulation 61-86.1 effective June 27, 2008, any analysis of non-friable organically bound (NOB) material that is found to be negative via PLM testing, must have confirmation testing via Transmission Electron Microscopy (TEM) on one sample from each medium; therefore, eight (8) samples were analyzed by the lab, via TEM testing.

4.2 Survey Results

Samples were collected and tested from various suspect materials, as referenced in Appendix B, Asbestos Sample Log. Samples of roof shingles, roofing felt, window caulk, wall slat caulk, tan sheet flooring, yellowish sheet flooring, basketweave sheet flooring and carpet backing were verified as negative, via TEM analysis.

Appendix C contains a copy of the analytical results from the laboratory.

TABLE 1
DILAPIDATED RESIDENTIAL BUILDING
22 MONROE STREET
SUMTER, SOUTH CAROLINA
PRESUMED ASBESTOS-CONTAINING MATERIAL (PACM)

Description	Location	Category (F/NF)	Approx. SF/LF
Chimney Flashing Sealant Material ⁽¹⁾	Base of Chimney at Roof Penetration	Presumed to Contain Asbestos – NF – Good Condition	8 LF

Note: F - Friable
NF - Non-Friable

(1) - The chimney could not be accessed, due to the compromised structural integrity of the roof; therefore, the flashing sealant is presumed to be asbestos containing material. The material appeared to be in good condition.

EMERALD, INC., CONDUCTED THE SURVEY TO THE BEST OF ITS ABILITY, ADHERING TO INDUSTRY STANDARDS. THE QUANTITIES PROVIDED IN THIS REPORT ARE APPROXIMATE AND SHALL SERVE AS A BASIS FOR ABATEMENT BID SUBMITTALS. IF ADDITIONAL SUSPECT MATERIALS ARE IDENTIFIED DURING RENOVATION OR DEMOLITION ACTIVITY, THE CONTRACTOR SHALL CEASE WORK AND NOTIFY THE BUILDING OWNER'S REPRESENTATIVE.

5.0 CONCLUSIONS AND RECOMMENDATIONS

Based upon the inspection of October 22, 2025, and the analytical results from the samples collected and tested by an independent laboratory, the dilapidated residential building located at 22 Monroe St. in Sumter, S.C., does contain intact chimney-flashing sealant material that is presumed to contain asbestos, as per Table 1. The material will have to be removed and properly disposed of by a S.C. licensed abatement contractor per SCDES Bureau of Air Quality Asbestos Regulation 61-86.1 effective May 27, 2011, prior to demolition activities involving the asbestos-containing sealant.

The roof structure is compromised in places; therefore, Emerald, Inc. recommends that an abatement contractor utilize a man-lift apparatus to access the chimney component at the ridge of the roof.

6.0 ASSUMPTIONS AND LIMITATIONS

The results, findings, conclusions and recommendations expressed in this report are based only on conditions that were observed during the inspection of October 22, 2025. Emerald, Inc., their representative and this report make no representation and/or assumptions as to past conditions or future occurrences. The information, conclusions and recommendations provided herein do not constitute as legal or medical advice. It is further understood that Emerald, Inc. makes no representations or warranties of any kind. Nor are such representations or warranties to be implied with respect to the data furnished. Emerald, Inc. assumes no responsibility with respect to the customers and its employees use thereof.

The information provided herein applies only to the subject property as it existed during Emerald, Inc.'s site visit. If this site's use and/or conditions change, information, observations and recommendations found herein would no longer apply. This report is intended to be used in its entirety. No excerpts may be taken to typify the findings of this survey. Emerald, Inc. shall not be liable for any special, consequential and/or exemplary damages resulting, in whole or in part, from the customer's use of the data provided. It was not within the scope of this investigation to remove surface materials to investigate portions of the structure or materials that lay beneath the surface. Our selection of sample locations and frequency is based upon our observations and the assumption that like materials in the same are homogeneous.

Emerald, Inc. conducted the survey to the best of its ability using the standards of the industry. In the event additional materials are found to contain asbestos, Emerald, Inc. shall not be liable for any failure of such findings during its initial survey.

EMSL maintains liability limited to cost of analysis. Interpretation and use of test results are the responsibility of the client. This report relates only to the samples reported above, and may not be reproduced, except in full, without written approval by EMSL. EMSL bears no responsibility for sample collection activities or analytical method limitations. The report reflects the samples as received. Results are generated from the field sampling data (sampling volumes and areas, locations, etc.) provided by the client on the Chain of Custody. Samples are within quality control criteria and met method specifications unless otherwise noted. EMSL recommends that samples reported as none detected or <1% undergo additional analysis via PLM to avoid the possibility of false negatives.

EMSL maintains liability limited to cost of analysis. Interpretation and use of test results are the responsibility of the client. This report relates only to the samples reported above, and may not be reproduced, except in full, without written approval by EMSL. EMSL bears no responsibility for sample collection activities or analytical method limitations. The report reflects the samples as received. Results are generated from the field sampling data (sampling volumes and areas, locations, etc.) provided by the client on the Chain of Custody. Samples are within quality control criteria and met method specifications unless otherwise noted. The above analyses were performed in general compliance with Appendix E to Subpart E of 40 CFR (previously EPA 600/M4-82-020 "Interim Method") but augmented with procedures outlined in the 1993 ("final") version of the method. This report must not be used by the client to claim product certification, approval, or endorsement by NVLAP, NIST or any agency of the federal government. Non-friable organically bound materials present a problem matrix and therefore EMSL recommends gravimetric reduction prior to analysis. Unless requested by the client, building materials manufactured with multiple layers (i.e. linoleum, wallboard, etc.) are reported as a single sample. Estimation of uncertainty is available on request.

Samples analyzed by EMSL Analytical, Inc. Kernersville, NC NVLAP Lab Code 102104-0, Virginia 3333-000228, West Virginia LT000321

FOREWORD

This report was prepared by Emerald, Inc. of Sumter, South Carolina, for the City of Sumter, regarding the dilapidated residential building located at 33 S. Blanding St. in Sumter, S.C. The contents of this report are confidential and intended for the use of the client only.

J. Dalton Reames, Jr., S.C. Licensed Building Inspector, conducted the inspection, and Ronny L. Lowder, S.C. Licensed Building Inspector and Management Planner, prepared this report. Any questions or comments concerning this report should be directed to Ronny L. Lowder at either (803) 469-5454 or via email at rlowder@emeraldinc-us.com.

1.0 INTRODUCTION AND OBJECTIVE

Emerald, Inc. was requested to conduct an Asbestos Survey of the vacant residential structure located at 33 S. Blanding St. in Sumter, S.C., to identify the presence of any asbestos-containing materials (ACM), prior to demolition activities. The inspection was authorized by Mr. John Macloskie, Codes Director, with the City of Sumter. The inspection included identification and assessment of the condition of suspect asbestos-containing materials, either friable or non-friable, on the interior and exterior portions of the structure.

This report is a compilation of the inspection and its results.

2.0 SURVEY METHODOLOGY

On November 12, 2024, Emerald, Inc. conducted an Asbestos Survey on the building at the stated address. J. Dalton Reames, Jr., South Carolina Licensed Building Inspector, conducted the inspection.

Estimated to have been constructed circa 1940 for residential purposes, the single-story residential structure contains approximately 1,600 square feet of interior space and was in a dilapidated state at the time of the survey. The basic building construction is as follows:

- Wood-framed Walls Built over an Earthen Crawl Space
- Wood Plank Exterior Walls
- Hipped, Wooden Roof Structure
 - Covered with Sheet Metal Panels
- Wood-slat Flooring Substrate
 - Tacked Carpet Coverings
 - Sheet Flooring Coverings

- Interior Walls
 - Plaster over Wood Lath (Original Walls)
 - Sheetrock with Joint Compound over Plaster
 - Sheetrock Attached to Wood Framework
- Ceiling Materials
 - Sheetrock with Joint Compound over and Dropped below Wood Slats
 - Cellulose-based Tiles Attached to Sheetrock
 - Stippled and Spray-applied Textures over Sheetrock
- No Climate-control Equipment Was Present

Future use of the property, following demolition activities, is unknown.

The survey included a visual inspection to identify the presence of material suspected of containing asbestos. This identification was based on the experience and training of the inspector. A total of fifty (50) samples were collected during the survey for laboratory analysis, based upon the required EPA and South Carolina Department of Environmental Services (SCDES) sampling matrix. Samples were placed in individual containers, labeled and numbered according to the sampling schemes (33-S-1 through 33-S-50). Per SCDES Asbestos Regulations, the independent laboratory is required to sample all layers of each sample. As a result, forty-six (46) samples were analyzed by the lab, via Polarized Light Microscopy (PLM) while utilizing Positive Stop, and six (6) samples were analyzed, via Transmission Electron Microscopy (TEM). Appendix B contains the Asbestos Survey Log kept during the inspection which identifies the samples collected by sample number, sample type, location and condition assessment, along with any comments. The samples were shipped to EMSL Analytical, Inc. in Kernersville, North Carolina for analysis. Analysis and results are discussed in Section 4.0.

3.0 HAZARD ASSESSMENT FACTORS (ASBESTOS)

3.1 Homogeneous Areas

The sample collection was typically conducted by homogeneous materials, i.e., any materials of the same type regarding uniformity throughout in structure or make-up and appearance (color, texture, and/or date of construction/application). Homogeneous materials can be further classified as surfacing materials, thermal system insulation and miscellaneous materials. Miscellaneous materials include ceiling tiles, floor tiles, roofing, caulking, and glazing, etc.

3.2 Hazard Factors

The samples of suspect material collected were classified as either friable (F) or non-friable (NF). Friable means the material can be crumbled, pulverized, or reduced to powder by ordinary hand pressure. Materials initially determined to be non-friable can receive a reclassification of friable if the material is damaged, thereby providing an avenue for release of asbestos fibers. Friable asbestos-containing material (ACM) has been determined by EPA and OSHA to be a greater hazard (health risk) than non-friable ACM. In assessing the fiber release potential, the current condition of the suspect materials sampled was noted in the Asbestos Survey Log (Appendix B). The condition was denoted as good, damaged, or significantly damaged. Current condition is a factor used to assess the potential for fiber release. Other factors used to determine potential fiber release include air movement, surface type, and area activity as related to human occupancy.

4.0 ANALYSIS AND RESULTS

4.1 Laboratory Analysis

Bulk samples were analyzed by EMSL Analytical, Inc. using Polarized Light Microscopy (PLM) with Dispersion Staining Techniques (EPA Bulk Analysis Method 600/R-93/116). This method utilizes part of the bulk sample which is mounted on a slide and exposed to an oil of specific refractive index. This prepared slide is then subjected to a variety of optical tests.

Each type of asbestos displays unique characteristics when subjected to these tests. Percentages of asbestos content are then determined through visual estimating. Although this is an estimate, any material containing greater than one percent of any type of asbestos is classified as ACM by the EPA. Any material classified as ACM must be handled accordingly.

Under the revised South Carolina Asbestos Regulation 61-86.1 effective June 27, 2008, any analysis of non-friable organically bound (NOB) material that is found to be negative via PLM testing, must have confirmation testing via Transmission Electron Microscopy (TEM) on one sample from each media; therefore, six (6) samples were analyzed by the lab, via TEM testing.

4.2 Survey Results

Samples were collected and tested from various suspect materials, as referenced in Appendix B, Asbestos Sample Log. Samples of window caulk, square-design sheet flooring, stylized-design sheet flooring, Room B carpet backing and padding, and Hallway carpet backing were verified as negative, via TEM analysis.

Appendix C contains a copy of the analytical results from the laboratory.
of the analytical results from the laboratory.

TABLE 1
DILAPIDATED RESIDENTIAL STRUCTURE
33 SOUTH BLANDING STREET
SUMTER, SOUTH CAROLINA
ASBESTOS-CONTAINING MATERIALS (ACM)

Description	Location	Category (F/NF)	Approx. SF/LF
Silver and Black-colored Roof Panel Sealant Materials	Sheet Metal Roofing Panels	Cat. I – NF – Good Condition	2,240 SF of Sheet Metal Roofing Panels
Window Glaze	Window Units	Cat. II – NF – Good Condition	576 LF
Stippled Ceiling Texture ⁽¹⁾	Ceiling in Room F	F – Good Condition	225 SF
Sheetrock with Joint Compound Ceiling and Wall System ⁽¹⁾	Ceilings and Interior Walls throughout the Structure	F – Damaged Condition	5,000 SF
Plaster Wall System ⁽¹⁾	<ul style="list-style-type: none"> - Behind Sheetrock Walls in Room Areas A, B, C, E, F, G and H - Standalone wall Surfacing in Closet Areas of Hallway E 	F – Damaged Condition	3,500 SF

Note: F - Friable

NF - Non-Friable

(1) - The Sheetrock with Joint Compound System and Plaster Wall Surfacing System are interconnected and fall within the same construction footprint within most of the structure. The Stippled Ceiling Texture in Room F is applied to an asbestos-containing sheetrock ceiling.

EMERALD, INC., CONDUCTED THE SURVEY TO THE BEST OF ITS ABILITY, ADHERING TO INDUSTRY STANDARDS. THE QUANTITIES PROVIDED IN THIS REPORT ARE APPROXIMATE AND SHALL SERVE AS A BASIS FOR ABATEMENT BID SUBMITTALS. IF ADDITIONAL SUSPECT MATERIALS ARE IDENTIFIED DURING RENOVATION OR DEMOLITION ACTIVITY, THE CONTRACTOR SHALL CEASE WORK AND NOTIFY THE BUILDING OWNER'S REPRESENTATIVE.

5.0 CONCLUSIONS AND RECOMMENDATIONS

Based upon the inspection of November 12, 2024, and the analytical results from the samples collected and tested by an independent laboratory, the dilapidated residential building located at 33 S. Blanding St. in Sumter, S.C., does contain friable and non-friable ACM, as per Table 1. Such materials will have to be removed and properly disposed by a S.C. licensed abatement contractor per SCDES Bureau of Air Quality Asbestos Regulation 61-86.1 effective May 27, 2011, prior to demolition activities involving the asbestos-containing materials.

6.0 ASSUMPTIONS AND LIMITATIONS

The results, findings, conclusions and recommendations expressed in this report are based only on conditions that were observed during the inspection of November 12, 2024. Emerald, Inc., their representative and this report make no representation and/or assumptions as to past conditions or future occurrences. The information, conclusions and recommendations provided herein do not constitute as legal or medical advice. It is further understood that Emerald, Inc. makes no representations or warranties of any kind. Nor are such representations or warranties to be implied with respect to the data furnished. Emerald, Inc. assumes no responsibility with respect to the customers and its employees use thereof.

The information provided herein applies only to the subject property as it existed during Emerald, Inc.'s site visit. If this site's use and/or conditions change, information, observations and recommendations found herein would no longer apply. This report is intended to be used in its entirety. No excerpts may be taken to typify the findings of this survey. Emerald, Inc. shall not be liable for any special, consequential and/or exemplary damages resulting, in whole or in part, from the customer's use of the data provided. It was not within the scope of this investigation to remove surface materials to investigate portions of the structure or materials that lay beneath the surface. Our selection of sample locations and frequency is based upon our observations and the assumption that like materials in the same are homogeneous.

Emerald, Inc. conducted the survey to the best of its ability using the standards of the industry. In the event additional materials are found to contain asbestos, Emerald, Inc. shall not be liable for any failure of such findings during its initial survey.

EMSL maintains liability limited to cost of analysis. Interpretation and use of test results are the responsibility of the client. This report relates only to the samples reported above, and may not be reproduced, except in full, without written approval by EMSL. EMSL bears no responsibility for sample collection activities or analytical method limitations. The report reflects the samples as received. Results are generated from the field sampling data (sampling volumes and areas, locations, etc.) provided by the client on the Chain of Custody. Samples are within quality control criteria and met method specifications unless otherwise noted. EMSL recommends that samples reported as none detected or < 1% undergo additional analysis via PLM to avoid the possibility of false negatives.

EMSL maintains liability limited to cost of analysis. Interpretation and use of test results are the responsibility of the client. This report relates only to the samples reported above, and may not be reproduced, except in full, without written approval by EMSL. EMSL bears no responsibility for sample collection activities or analytical method limitations. The report reflects the samples as received. Results are generated from the field sampling data (sampling volumes and areas, locations, etc.) provided by the client on the Chain of Custody. Samples are within quality control criteria and met method specifications unless otherwise noted. The above analyses were performed in general compliance with Appendix E to Subpart E of 40 CFR (previously EPA 600/M4-82-020 "Interim Method") but augmented with procedures outlined in the 1993 ("final") version of the method. This report must not be used by the client to claim product certification, approval, or endorsement by NVLAP, NIST or any agency of the federal government. Non-friable organically bound materials present a problem matrix and therefore EMSL recommends gravimetric reduction prior to analysis. Unless requested by the client, building materials manufactured with multiple layers (i.e. linoleum, wallboard, etc.) are reported as a single sample. Estimation of uncertainty is available on request.

Samples analyzed by EMSL Analytical, Inc. Kenersville, NC NVLAP Lab Code 102104-0, Virginia 3333-000228, West Virginia LT000321

FOREWORD

This report was prepared by Emerald, Inc. of Sumter, South Carolina, for the City of Sumter, regarding the dilapidated residential building and associated storage structure located at 106 G St. in Sumter, S.C. The contents of this report are confidential and intended for the use of the client only.

J. Dalton Reames, Jr., S.C. Licensed Building Inspector, conducted the inspection, and Ronny L. Lowder, S.C. Licensed Building Inspector and Management Planner, prepared this report. Any questions or comments concerning this report should be directed to Ronny L. Lowder at either (803) 469-5454 or via email at rlowder@emeraldinc-us.com.

1.0 INTRODUCTION AND OBJECTIVE

Emerald, Inc. was requested to conduct an Asbestos Survey of the vacant residential structure located at 106 G St. in Sumter, S.C., to identify the presence of any asbestos-containing materials (ACM), prior to demolition activities. The inspection was authorized by Mr. John Macloskie, Codes Director, with the City of Sumter. The inspection included identification and assessment of the condition of suspect asbestos-containing materials, either friable or non-friable, on the interior and exterior portions of the structure.

This report is a compilation of the inspection and its results.

2.0 SURVEY METHODOLOGY

On November 11, 2024, Emerald, Inc. conducted an Asbestos Survey on the building at the stated address. J. Dalton Reames, Jr., South Carolina Licensed Building Inspector, conducted the inspection.

Estimated to have been constructed circa 1942 for residential purposes, the single-story residential structure contains approximately 490 square feet of interior space and was in a dilapidated state at the time of the survey. The basic building construction is as follows:

- Wood-framed Walls Built over an Earthen Crawl Space
- Cellulose-based Panels over Wood Slat Exterior Walls
- Wooden A-framed Roof Structure
 - Covered with Sheet Metal Panels
- Slanted Wooden Roof Section over Restroom
 - Covered with Rolled Shingles and Associated Felt
- Uncovered Hardwood Flooring
- Interior Walls have Wood Paneling, Wood Slats and Cellulose-based Panels

- Wooden Ceiling Joists Covered with Wood Slats and Fiberboard Panels
- No Climate-control Equipment Was Present
- Standalone Storage Shed Constructed of Wood with Shingled A-frame Roof

Future use of the property, following demolition activities, is unknown.

The survey included a visual inspection to identify the presence of material suspected of containing asbestos. This identification was based on the experience and training of the inspector. A total of twenty-four (24) samples were collected during the survey for laboratory analysis, based upon the required EPA and South Carolina Department of Environmental Services (SCDES) sampling matrix. Samples were placed in individual containers, labeled and numbered according to the sampling schemes (106G-1 through 106G-24). Per SCDES Asbestos Regulations, the independent laboratory is required to sample all layers of each sample. As a result, seventeen (17) samples were analyzed by the lab, via Polarized Light Microscopy (PLM) while utilizing Positive Stop, and four (4) samples were analyzed, via Transmission Electron Microscopy (TEM). Appendix B contains the Asbestos Survey Log kept during the inspection which identifies the samples collected by sample number, sample type, location and condition assessment, along with any comments. The samples were shipped to EMSL Analytical, Inc. in Kernersville, North Carolina for analysis. Analysis and results are discussed in Section 4.0.

3.0 HAZARD ASSESSMENT FACTORS (ASBESTOS)

3.1 Homogeneous Areas

The sample collection was typically conducted by homogeneous materials, i.e., any materials of the same type regarding uniformity throughout in structure or make-up and appearance (color, texture, and/or date of construction/application). Homogeneous materials can be further classified as surfacing materials, thermal system insulation and miscellaneous materials. Miscellaneous materials include ceiling tiles, floor tiles, roofing, caulking, and glazing, etc.

3.2 Hazard Factors

The samples of suspect material collected were classified as either friable (F) or non-friable (NF). Friable means the material can be crumbled, pulverized, or reduced to powder by ordinary hand pressure. Materials initially determined to be non-friable can receive a reclassification of friable if the material is damaged, thereby providing an avenue for release of asbestos fibers. Friable asbestos-containing material (ACM) has been determined by EPA and OSHA to be a greater hazard (health risk) than non-friable ACM. In assessing the fiber release potential, the current condition of the suspect materials sampled was noted in the Asbestos Survey Log (Appendix B). The condition was denoted as good, damaged, or significantly damaged. Current condition is a factor used to assess the potential for fiber release. Other factors used to determine potential fiber release include air movement, surface type, and area activity as related to human occupancy.

4.0 ANALYSIS AND RESULTS

4.1 Laboratory Analysis

Bulk samples were analyzed by EMSL Analytical, Inc. using Polarized Light Microscopy (PLM) with Dispersion Staining Techniques (EPA Bulk Analysis Method 600/R-93/116). This method utilizes part of the bulk sample which is mounted on a slide and exposed to an oil of specific refractive index. This prepared slide is then subjected to a variety of optical tests.

Each type of asbestos displays unique characteristics when subjected to these tests. Percentages of asbestos content are then determined through visual estimating. Although this is an estimate, any material containing greater than one percent of any type of asbestos is classified as ACM by the EPA. Any material classified as ACM must be handled accordingly.

Under the revised South Carolina Asbestos Regulation 61-86.1 effective June 27, 2008, any analysis of non-friable organically bound (NOB) material that is found to be negative via PLM testing, must have confirmation testing via Transmission Electron Microscopy (TEM) on one sample from each media; therefore, four (4) samples were analyzed by the lab, via TEM testing.

4.2 Survey Results

Samples were collected and tested from various suspect materials, as referenced in Appendix B, Asbestos Sample Log. Samples of residential structure rolled shingles and associated felt, window glaze⁽¹⁾ and shed roof shingles were verified as negative, via TEM analysis.

Appendix C contains a copy of the analytical results from the laboratory.
of the analytical results from the laboratory.

**TABLE 1
DILAPIDATED RESIDENTIAL STRUCTURE
106 G STREET
SUMTER, SOUTH CAROLINA
ASBESTOS-CONTAINING MATERIALS (ACM)**

Description	Location	Category (F/NF)	Approx. SF/LF
Silver Roof Panel Sealant and Tar-based Roof Panel Sealant	Sheet Metal Roofing Panels	Cat. I – NF – Good Condition	637 SF of Sheet Metal Roofing Panels
Chimney Base and Roof Ridge Sealant Material	Roof Penetration of Two Chimney Structures and Roof Ridge of Residential Building	Cat. I – NF – Good Condition	55 LF

Note: F - Friable

NF - Non-Friable

(1) - Asbestos detected at <1%, via PLM Analysis, in one sample of window glaze; however, the material was verified as negative, via TEM Analysis.

EMERALD, INC., CONDUCTED THE SURVEY TO THE BEST OF ITS ABILITY, ADHERING TO INDUSTRY STANDARDS. THE QUANTITIES PROVIDED IN THIS REPORT ARE APPROXIMATE AND SHALL SERVE AS A BASIS FOR ABATEMENT BID SUBMITTALS. IF ADDITIONAL SUSPECT MATERIALS ARE IDENTIFIED DURING RENOVATION OR DEMOLITION ACTIVITY, THE CONTRACTOR SHALL CEASE WORK AND NOTIFY THE BUILDING OWNER'S REPRESENTATIVE.

5.0 CONCLUSIONS AND RECOMMENDATIONS

Based upon the inspection of November 11, 2024, and the analytical results from the samples collected and tested by an independent laboratory, the dilapidated residential building located at 106 G St. in Sumter, S.C., does contain non-friable ACM, as per Table 1. Such materials will have to be removed and properly disposed by a S.C. licensed abatement contractor per SCDES Bureau of Air Quality Asbestos Regulation 61-86.1 effective May 27, 2011, prior to demolition activities involving the asbestos-containing materials.

6.0 ASSUMPTIONS AND LIMITATIONS

The results, findings, conclusions and recommendations expressed in this report are based only on conditions that were observed during the inspection of November 11, 2024. Emerald, Inc., their representative and this report make no representation and/or assumptions as to past conditions or future occurrences. The information, conclusions and recommendations provided herein do not constitute as legal or medical advice. It is further understood that Emerald, Inc. makes no representations or warranties of any kind. Nor are such representations or warranties to be implied with respect to the data furnished. Emerald, Inc. assumes no responsibility with respect to the customers and its employees use thereof.

The information provided herein applies only to the subject property as it existed during Emerald, Inc.'s site visit. If this site's use and/or conditions change, information, observations and recommendations found herein would no longer apply. This report is intended to be used in its entirety. No excerpts may be taken to typify the findings of this survey. Emerald, Inc. shall not be liable for any special, consequential and/or exemplary damages resulting, in whole or in part, from the customer's use of the data provided. It was not within the scope of this investigation to remove surface materials to investigate portions of the structure or materials that lay beneath the surface. Our selection of sample locations and frequency is based upon our observations and the assumption that like materials in the same are homogeneous.

Emerald, Inc. conducted the survey to the best of its ability using the standards of the industry. In the event additional materials are found to contain asbestos, Emerald, Inc. shall not be liable for any failure of such findings during its initial survey.

EMSL maintains liability limited to cost of analysis. Interpretation and use of test results are the responsibility of the client. This report relates only to the samples reported above, and may not be reproduced, except in full, without written approval by EMSL. EMSL bears no responsibility for sample collection activities or analytical method limitations. The report reflects the samples as received. Results are generated from the field sampling data (sampling volumes and areas, locations, etc.) provided by the client on the Chain of Custody. Samples are within quality control criteria and met method specifications unless otherwise noted. The above analyses were performed in general compliance with Appendix E to Subpart E of 40 CFR (previously EPA 600/M4-82-020 "Interim Method") but augmented with procedures outlined in the 1993 ("final") version of the method. This report must not be used by the client to claim product certification, approval, or endorsement by NVLAP, NIST or any agency of the federal government. Non-friable organically bound materials present a problem matrix and therefore EMSL recommends gravimetric reduction prior to analysis. Unless requested by the client, building materials manufactured with multiple layers (i.e. linoleum, wallboard, etc.) are reported as a single sample. Estimation of uncertainty is available on request.

FOREWORD

This report was prepared by Emerald, Inc. of Sumter, South Carolina, for the City of Sumter, regarding the dilapidated residential building located at 110 G St. in Sumter, S.C. The contents of this report are confidential and intended for the use of the client only.

J. Dalton Reames, Jr., S.C. Licensed Building Inspector, conducted the inspection, and Ronny L. Lowder, S.C. Licensed Building Inspector and Management Planner, prepared this report. Any questions or comments concerning this report should be directed to Ronny L. Lowder at either (803) 469-5454 or via email at rlowder@emeraldinc-us.com.

1.0 INTRODUCTION AND OBJECTIVE

Emerald, Inc. was requested to conduct an Asbestos Survey of the vacant residential structure located at 110 G St. in Sumter, S.C., to identify the presence of any asbestos-containing materials (ACM), prior to demolition activities. The inspection was authorized by Mr. John Macloskie, Codes Director, with the City of Sumter. The inspection included identification and assessment of the condition of suspect asbestos-containing materials, either friable or non-friable, on the interior and exterior portions of the structure.

This report is a compilation of the inspection and its results.

2.0 SURVEY METHODOLOGY

On November 11, 2024, Emerald, Inc. conducted an Asbestos Survey on the building at the stated address. J. Dalton Reames, Jr., South Carolina Licensed Building Inspector, conducted the inspection.

Estimated to have been constructed circa 1942 for residential purposes, the single-story residential structure contains approximately 490 square feet of interior space and was in a dilapidated state, at the time of the survey. The basic building construction is as follows:

- Wood-framed Walls Built over an Earthen Crawl Space
- Vinyl Cladding Covers Wood Slat Exterior Walls
- Wooden A-framed Roof Structure
 - Covered with Sheet Metal Panels
- Slanted Wooden Roof Section over Restroom
 - Covered with Shingles and Associated Felt
- Uncovered Hardwood Flooring
 - Rolled-up Carpeting Staged on Floor

- Wood Paneling, Wood Slats and Cellulose-based Panels cover Wood-framed Interior Walls
- Wooden Ceiling Joists Covered with Sheetrock, Fiberboard Panels and Wood Slats
- No Climate-control Equipment Was Present

Future use of the property, following demolition activities, is unknown.

The survey included a visual inspection to identify the presence of material suspected of containing asbestos. This identification was based on the experience and training of the inspector. A total of thirty (30) samples were collected during the survey for laboratory analysis, based upon the required EPA and South Carolina Department of Environmental Services (SCDES) sampling matrix. Samples were placed in individual containers, labeled and numbered according to the sampling schemes (110G-1 through 110G-30). Per SCDES Asbestos Regulations, the independent laboratory is required to sample all layers of each sample. As a result, twenty-six (26) samples were analyzed by the lab, via Polarized Light Microscopy (PLM) while utilizing Positive Stop, and four (4) samples were analyzed, via Transmission Electron Microscopy (TEM). Appendix B contains the Asbestos Survey Log kept during the inspection which identifies the samples collected by sample number, sample type, location and condition assessment, along with any comments. The samples were shipped to EMSL Analytical, Inc. in Kernersville, North Carolina for analysis. Analysis and results are discussed in Section 4.0.

3.0 HAZARD ASSESSMENT FACTORS (ASBESTOS)

3.1 Homogeneous Areas

The sample collection was typically conducted by homogeneous materials, i.e., any materials of the same type regarding uniformity throughout in structure or make-up and appearance (color, texture, and/or date of construction/application). Homogeneous materials can be further classified as surfacing materials, thermal system insulation and miscellaneous materials. Miscellaneous materials include ceiling tiles, floor tiles, roofing, caulking, and glazing, etc.

3.2 Hazard Factors

The samples of suspect material collected were classified as either friable (F) or non-friable (NF). Friable means the material can be crumbled, pulverized, or reduced to powder by ordinary hand pressure. Materials initially determined to be non-friable can receive a reclassification of friable if the material is damaged, thereby providing an avenue for release of asbestos fibers. Friable asbestos-containing material (ACM) has been determined by EPA and OSHA to be a greater hazard (health risk) than non-friable ACM. In assessing the fiber release potential, the current condition of the suspect materials sampled was noted in the Asbestos Survey Log (Appendix B). The condition was denoted as good, damaged, or significantly damaged. Current condition is a factor used to assess the potential for fiber release. Other factors used to determine potential fiber release include air movement, surface type, and area activity as related to human occupancy.

4.0 ANALYSIS AND RESULTS

4.1 Laboratory Analysis

Bulk samples were analyzed by EMSL Analytical, Inc. using Polarized Light Microscopy (PLM) with Dispersion Staining Techniques (EPA Bulk Analysis Method 600/R-93/116). This method utilizes part of the bulk sample which is mounted on a slide and exposed to an oil of specific refractive index. This prepared slide is then subjected to a variety of optical tests.

Each type of asbestos displays unique characteristics when subjected to these tests. Percentages of asbestos content are then determined through visual estimating. Although this is an estimate, any material containing greater than one percent of any type of asbestos is classified as ACM by the EPA. Any material classified as ACM must be handled accordingly.

Under the revised South Carolina Asbestos Regulation 61-86.1 effective June 27, 2008, any analysis of non-friable organically bound (NOB) material that is found to be negative via PLM testing, must have confirmation testing via Transmission Electron Microscopy (TEM) on one sample from each media; therefore, four (4) samples were analyzed by the lab, via TEM testing.

4.2 Survey Results

Samples were collected and tested from various suspect materials, as referenced in Appendix B, Asbestos Sample Log. Samples of roofing shingles and carpet backing were verified as negative, via TEM analysis.

Appendix C contains a copy of the analytical results from the laboratory.
of the analytical results from the laboratory.

**TABLE 1
DILAPIDATED RESIDENTIAL STRUCTURE
110 G STREET
SUMTER, SOUTH CAROLINA
ASBESTOS-CONTAINING MATERIALS (ACM)**

Description	Location	Category (F/NF)	Approx. SF/LF
Silver Roof Panel Sealant, Tar-based Roof Panel Sealant and Tar-based Sheet Metal Seam Sealant	Sheet Metal Roofing Panels	Cat. I – NF – Good Condition	560 SF of Sheet Metal Roofing Panels

(2) - Asbestos Detected in Roofing Felt Paper at <0.1%

EMERALD, INC., CONDUCTED THE SURVEY TO THE BEST OF ITS ABILITY, ADHERING TO INDUSTRY STANDARDS. THE QUANTITIES PROVIDED IN THIS REPORT ARE APPROXIMATE AND SHALL SERVE AS A BASIS FOR ABATEMENT BID SUBMITTALS. IF ADDITIONAL SUSPECT MATERIALS ARE IDENTIFIED DURING RENOVATION OR DEMOLITION ACTIVITY, THE CONTRACTOR SHALL CEASE WORK AND NOTIFY THE BUILDING OWNER'S REPRESENTATIVE.

5.0 CONCLUSIONS AND RECOMMENDATIONS

Based upon the inspection of November 11, 2024, and the analytical results from the samples collected and tested by an independent laboratory, the dilapidated residential building located at 110 G St. in Sumter, S.C., does contain non-friable ACM, as per Table 1. Such materials will have to be removed and properly disposed by a S.C. licensed abatement contractor per SCDES Bureau of Air Quality Asbestos Regulation 61-86.1 effective May 27, 2011, prior to demolition activities involving the asbestos-containing materials.

6.0 ASSUMPTIONS AND LIMITATIONS

The results, findings, conclusions and recommendations expressed in this report are based only on conditions that were observed during the inspection of November 11, 2024. Emerald, Inc., their representative and this report make no representation and/or assumptions as to past conditions or future occurrences. The information, conclusions and recommendations provided herein do not constitute as legal or medical advice. It is further understood that Emerald, Inc. makes no representations or warranties of any kind. Nor are such representations or warranties to be implied with respect to the data furnished. Emerald, Inc. assumes no responsibility with respect to the customers and its employees use thereof.

The information provided herein applies only to the subject property as it existed during Emerald, Inc.'s site visit. If this site's use and/or conditions change, information, observations and recommendations found herein would no longer apply. This report is intended to be used in its entirety. No excerpts may be taken to typify the findings of this survey. Emerald, Inc. shall not be liable for any special, consequential and/or exemplary damages resulting, in whole or in part, from the customer's use of the data provided. It was not within the scope of this investigation to remove surface materials to investigate portions of the structure or materials that lay beneath the surface. Our selection of sample locations and frequency is based upon our observations and the assumption that like materials in the same are homogeneous.

Emerald, Inc. conducted the survey to the best of its ability using the standards of the industry. In the event additional materials are found to contain asbestos, Emerald, Inc. shall not be liable for any failure of such findings during its initial survey.

EMSL maintains liability limited to cost of analysis. Interpretation and use of test results are the responsibility of the client. This report relates only to the samples reported above, and may not be reproduced, except in full, without written approval by EMSL. EMSL bears no responsibility for sample collection activities or analytical method limitations. The report reflects the samples as received. Results are generated from the field sampling data (sampling volumes and areas, locations, etc.) provided by the client on the Chain of Custody. Samples are within quality control criteria and met method specifications unless otherwise noted. EMSL recommends that samples reported as none detected or < 1% undergo additional analysis via PLM to avoid the possibility of false negatives.

EMSL maintains liability limited to cost of analysis. Interpretation and use of test results are the responsibility of the client. This report relates only to the samples reported above, and may not be reproduced, except in full, without written approval by EMSL. EMSL bears no responsibility for sample collection activities or analytical method limitations. The report reflects the samples as received. Results are generated from the field sampling data (sampling volumes and areas, locations, etc.) provided by the client on the Chain of Custody. Samples are within quality control criteria and met method specifications unless otherwise noted. The above analyses were performed in general compliance with Appendix E to Subpart E of 40 CFR (previously EPA 600/M4-82-020 "Interim Method") but augmented with procedures outlined in the 1993 ("final") version of the method. This report must not be used by the client to claim product certification, approval, or endorsement by NVLAP, NIST or any agency of the federal government. Non-friable organically bound materials present a problem matrix and therefore EMSL recommends gravimetric reduction prior to analysis. Unless requested by the client, building materials manufactured with multiple layers (i.e. linoleum, wallboard, etc.) are reported as a single sample. Estimation of uncertainty is available on request.

Samples analyzed by EMSL Analytical, Inc. Kenersville, NC NVLAP Lab Code 102104-0, Virginia 3333-000228, West Virginia LT000321

1.0 INTRODUCTION AND OBJECTIVE

Emerald, Inc. was requested to conduct an Asbestos Survey of the vacant residential structure located at 125 Lawson St. in Sumter, S.C., to identify the presence of any asbestos-containing materials (ACM), prior to demolition activities. The inspection was authorized by Mr. John Macloskie, Codes Director, with the City of Sumter. The inspection included identification and assessment of the condition of suspect asbestos-containing materials, either friable or non-friable, on the interior and exterior portions of the structure.

This report is a compilation of the inspection and its results.

2.0 SURVEY METHODOLOGY

On October 22, 2025, Emerald, Inc. conducted an Asbestos Survey of the building at the stated location. J. Dalton Reames, Jr., South Carolina Licensed Building Inspector, conducted the inspection.

Constructed circa 1950 for residential purposes, the single-story structure contains approximately 660 square feet of interior space and was in dilapidated condition, at the time of the survey. Wood-framed walls and floors are built over an earthen crawlspace. The basic building components are as follows:

- Exterior Walls
 - Vinyl veneer over foam sheathing panels and wood planks
- Wooden, A-framed roof covered with shingles and felt
- Wood floor substrate attached to wood joists
 - Sheet flooring layers in Room D
- Wood-framed Interior Walls
 - Wood strips attached to wood framework

- Sheetrock system attached to wood framework
 - Wood paneling over wood strips and sheetrock sections
- Ceilings
 - Wood strips attached to wooden joists
 - Cellulose-based ceiling tiles attached to wood joists
 - Sheetrock attached to wooden joists in Room E
- Climate control equipment was not present

Future use of the property, following demolition activities, is unknown.

The survey included a visual inspection to identify the presence of materials suspected of containing asbestos. This identification was based on the experience and training of the inspector. A total of twenty-one (21) samples were collected during the survey for laboratory analysis, based upon the required EPA and South Carolina Department of Environmental Services (SCDES) sampling matrix. Samples were placed in individual containers, labeled and numbered according to the sampling scheme (125-1 through 125-21). Per SCDES Asbestos Regulations, the independent laboratory is required to analyze all layers of each sample. As a result of some sample materials containing multiple layers that were identified by the laboratory (e.g. sheetrock with joint compound and tape layers) eighteen (18) samples were analyzed by the lab, via Polarized Light Microscopy (PLM) while utilizing Positive Stop, and four (4) samples were analyzed, via Transmission Electron Microscopy (TEM). Appendix B contains the Asbestos Survey Log kept during the inspection which identifies the samples collected by sample number, sample type, location and condition assessment, along with any comments. The samples were shipped to EMSL Analytical, Inc. in Kernersville, North Carolina for analysis. Analysis and results are discussed in Section 4.0.

3.0 HAZARD ASSESSMENT FACTORS (ASBESTOS)

3.1 Homogeneous Areas

The sample collection was typically conducted by homogeneous materials, i.e., any materials of the same type regarding uniformity throughout in structure or make-up and appearance (color, texture, and/or date of construction/application). Homogeneous materials can be further classified as surfacing materials, thermal system insulation and miscellaneous materials. Miscellaneous materials include ceiling tiles, floor tiles, roofing, caulking, and glazing, etc.

3.2 Hazard Factors

The samples of suspect material collected were classified as either friable (F) or non-friable (NF). Friable means the material can be crumbled, pulverized, or reduced to powder by ordinary hand pressure. Materials initially determined to be non-friable can receive a reclassification of friable if the material is damaged, thereby providing an avenue for release of asbestos fibers. Friable asbestos-containing material (ACM) has been determined by EPA and OSHA to be a greater hazard (health risk) than non-friable ACM. In assessing the fiber release potential, the current condition of the suspect materials sampled was noted in the Asbestos Survey Log (Appendix B). The condition was denoted as good, damaged, or significantly damaged. Current condition is a factor used to assess the potential for fiber release. Other factors used to determine potential fiber release include air movement, surface type, and area activity as related to human occupancy.

4.0 ANALYSIS AND RESULTS

4.1 Laboratory Analysis

Samples were analyzed by EMSL Analytical, Inc. using Polarized Light Microscopy (PLM) with Dispersion Staining Techniques (EPA Bulk Analysis Method 600/R-93/116). This method utilizes part of the bulk sample which is mounted on a slide and exposed to an oil of specific refractive index. This prepared slide is then subjected to a variety of optical tests.

Each type of asbestos displays unique characteristics when subjected to these tests. Percentages of asbestos content are then determined through visual estimating. Although this is an estimate, any material containing greater than one percent of any type of asbestos is classified as ACM by the EPA. Any material classified as ACM must be handled accordingly.

Under the revised South Carolina Asbestos Regulation 61-86.1 effective June 27, 2008, any analysis of non-friable organically bound (NOB) material that is found to be negative via PLM testing, must have confirmation testing via Transmission Electron Microscopy (TEM) on one sample from each medium; therefore, four (4) samples were analyzed by the lab, via TEM testing.

4.2 Survey Results

Samples were collected and tested from various suspect materials, as referenced in Appendix B, Asbestos Sample Log. Samples of roof shingles, roofing felt, window units' caulk, and parquet-designed sheet flooring were verified as negative, via TEM analysis.

Appendix C contains a copy of the analytical results from the laboratory.

**TABLE 1
DILAPIDATED RESIDENTIAL STRUCTURE
125 LAWSON STREET
SUMTER, SOUTH CAROLINA
ASBESTOS-CONTAINING MATERIAL (ACM)**

Description	Location	Category (F/NF)	Approx. SF/LF
Tan-colored, Bottom-layer Resilient Sheet Flooring	Bottom Layer of Sheet Flooring in Room D	F – Damaged Condition	144 SF
Sheetrock with Joint Compound System	<ul style="list-style-type: none"> - East Walls in Rooms A and B - West Walls in Rooms C and D - Ceiling and Walls in Room E 	F – Damaged Condition	610 SF
Chimney Flashing Sealant ⁽¹⁾	Base of the Rooftop Penetration	Presumed Asbestos-containing Material – Cat. I – Good Condition	8 LF

Note: F - Friable

NF - Non-Friable

(1) - The chimney flashing material at the upper roof chimney penetration could not be accessed for assessment and sample collection purposes; therefore, the sealant material is presumed to contain asbestos. The material was in good condition.

EMERALD, INC., CONDUCTED THE SURVEY TO THE BEST OF ITS ABILITY, ADHERING TO INDUSTRY STANDARDS. THE QUANTITIES PROVIDED IN THIS REPORT ARE APPROXIMATE AND SHALL SERVE AS A BASIS FOR ABATEMENT BID SUBMITTALS. IF ADDITIONAL SUSPECT MATERIALS ARE IDENTIFIED DURING RENOVATION OR DEMOLITION ACTIVITY, THE CONTRACTOR SHALL CEASE WORK AND NOTIFY THE BUILDING OWNER'S REPRESENTATIVE.

5.0 CONCLUSIONS AND RECOMMENDATIONS

Based upon the inspection of October 22, 2025, and the analytical results from the samples collected and tested by an independent laboratory, the dilapidated residential structure located at 125 Lawson St. in Sumter, S.C., does contain friable and non-friable ACM, as per Table 1. Such materials will have to be removed and properly disposed of by a S.C. licensed abatement contractor per SCDES Bureau of Air Quality Asbestos Regulation 61-86.1 effective May 27, 2011, prior to demolition activities involving the asbestos-containing materials.

While portions of the residential structure are dilapidated, Mr. Reames was able to traverse the interior areas of the building that have asbestos-containing sheet flooring and sheetrock wall sections without difficulty; however, the chimney flashing material could not be accessed, due to the compromised state of the roof structure. Emerald, Inc., recommends that a licensed codes enforcement officer representing the City or County of Sumter, or a professional engineer, inspect the structure and, subsequently, generate an official letter that addresses any hazardous issues related to abatement or demolition personnel entering the building.

6.0 ASSUMPTIONS AND LIMITATIONS

The results, findings, conclusions and recommendations expressed in this report are based only on conditions that were observed during the inspection of October 22, 2025. Emerald, Inc., their representative and this report make no representation and/or assumptions as to past conditions or future occurrences. The information, conclusions and recommendations provided herein do not constitute as legal or medical advice. It is further understood that Emerald, Inc. makes no representations or warranties of any kind. Nor are such representations or warranties to be implied with respect to the data furnished. Emerald, Inc. assumes no responsibility with respect to the customers and its employees use thereof.

The information provided herein applies only to the subject property as it existed during Emerald, Inc.'s site visit. If this site's use and/or conditions change, information, observations and recommendations found herein would no longer apply. This report is intended to be used in its entirety. No excerpts may be taken to typify the findings of this survey. Emerald, Inc. shall not be liable for any special, consequential and/or exemplary damages resulting, in whole or in part, from the customer's use of the data provided. It was not within the scope of this investigation to remove surface materials to investigate portions of the structure or materials that lay beneath the surface. Our selection of sample locations and frequency is based upon our observations and the assumption that like materials in the same are homogeneous.

Emerald, Inc. conducted the survey to the best of its ability using the standards of the industry. In the event additional materials are found to contain asbestos, Emerald, Inc. shall not be liable for any failure of such findings during its initial survey.

EMSL maintains liability limited to cost of analysis. Interpretation and use of test results are the responsibility of the client. This report relates only to the samples reported above, and may not be reproduced, except in full, without written approval by EMSL. EMSL bears no responsibility for sample collection activities or analytical method limitations. The report reflects the samples as received. Results are generated from the field sampling data (sampling volumes and areas, locations, etc.) provided by the client on the Chain of Custody. Samples are within quality control criteria and met method specifications unless otherwise noted. EMSL recommends that samples reported as none detected or <1% undergo additional analysis via PLM to avoid the possibility of false negatives.

EMSL maintains liability limited to cost of analysis. Interpretation and use of test results are the responsibility of the client. This report relates only to the samples reported above, and may not be reproduced, except in full, without written approval by EMSL. EMSL bears no responsibility for sample collection activities or analytical method limitations. The report reflects the samples as received. Results are generated from the field sampling data (sampling volumes and areas, locations, etc.) provided by the client on the Chain of Custody. Samples are within quality control criteria and met method specifications unless otherwise noted. The above analyses were performed in general compliance with Appendix E to Subpart E of 40 CFR (previously EPA 600/M4-82-020 "Interim Method") but augmented with procedures outlined in the 1993 ("final") version of the method. This report must not be used by the client to claim product certification, approval, or endorsement by NVLAP, NIST or any agency of the federal government. Non-friable organically bound materials present a problem matrix and therefore EMSL recommends gravimetric reduction prior to analysis. Unless requested by the client, building materials manufactured with multiple layers (i.e. linoleum, wallboard, etc.) are reported as a single sample. Estimation of uncertainty is available on request.

Samples analyzed by EMSL Analytical, Inc. Kernersville, NC NVLAP Lab Code 102104-0, Virginia 3333-000228, West Virginia LT000321

1.0 INTRODUCTION AND OBJECTIVE

Emerald, Inc. was requested to conduct an Asbestos Survey of the vacant residential structure and standalone garage building located 208 W. Oakland Ave. in Sumter, S.C., to identify the presence of any asbestos-containing materials (ACM), prior to demolition activities. The inspection was authorized by Mr. John Macloskie, Codes Director, with the City of Sumter. The inspection included identification and assessment of the condition of suspect asbestos-containing materials, either friable or non-friable, on the interior and exterior portions of the structure.

This report is a compilation of the inspection and its results.

2.0 SURVEY METHODOLOGY

On October 21, 2025, Emerald, Inc. conducted an Asbestos Survey of the building at the stated location. J. Dalton Reames, Jr., South Carolina Licensed Building Inspector, conducted the inspection.

Constructed circa 1900 for residential purposes, the two-story structure contains approximately 1,475 square feet of interior space and was in dilapidated condition, at the time of the survey. Wood-framed walls and floors are built over an earthen crawlspace. The basic building components of the residential structure and garage building are as follows:

Residential Structure

- Wood plank exterior walls
- Wooden gable-design and hipped-design roof structures covered with asphaltic shingles and felt
- Wood floor substrate attached to wood joists
 - Floating sheet flooring layers

- Uncovered wood plank areas
- Wood-framed Interior Walls
 - Plaster surfacing system over wooden lathwork
- Wood ceiling joists covered with wood strips
- Climate Control Equipment
 - Brick chimney structure penetrates the roof above the second floor

Standalone Garage Building

- Wood-framed and wood-sided structure measuring approximately 20' x 10'
- Built over bare earth
- Wood-framed roof covered with crimped sheet metal panels

Future use of the property, following demolition activities, is unknown.

The survey included a visual inspection to identify the presence of materials suspected of containing asbestos. This identification was based on the experience and training of the inspector. A total of forty-six (46) samples were collected during the survey for laboratory analysis, based upon the required EPA and South Carolina Department of Environmental Services (SCDES) sampling matrix. Samples were placed in individual containers, labeled and numbered according to the sampling scheme (208-1 through 208-46). Per SCDES Asbestos Regulations, the independent laboratory is required to analyze all layers of each sample. As a result of some sample materials containing multiple layers that were identified by the laboratory (e.g. plaster material with skim coats and rough coats) forty-two (42) samples were analyzed by the lab, via Polarized Light Microscopy (PLM) while utilizing Positive Stop, and eight (8) samples were analyzed, via Transmission Electron Microscopy (TEM). Appendix B contains the Asbestos Survey Log kept during the inspection which identifies the samples collected by sample number,

sample type, location and condition assessment, along with any comments. The samples were shipped to EMSL Analytical, Inc. in Kernersville, North Carolina for analysis. Analysis and results are discussed in Section 4.0.

3.0 HAZARD ASSESSMENT FACTORS (ASBESTOS)

3.1 Homogeneous Areas

The sample collection was typically conducted by homogeneous materials, i.e., any materials of the same type regarding uniformity throughout in structure or make-up and appearance (color, texture, and/or date of construction/application). Homogeneous materials can be further classified as surfacing materials, thermal system insulation and miscellaneous materials. Miscellaneous materials include ceiling tiles, floor tiles, roofing, caulking, and glazing, etc.

3.2 Hazard Factors

The samples of suspect material collected were classified as either friable (F) or non-friable (NF). Friable means the material can be crumbled, pulverized, or reduced to powder by ordinary hand pressure. Materials initially determined to be non-friable can receive a reclassification of friable if the material is damaged, thereby providing an avenue for release of asbestos fibers. Friable asbestos-containing material (ACM) has been determined by EPA and OSHA to be a greater hazard (health risk) than non-friable ACM. In assessing the fiber release potential, the current condition of the suspect materials sampled was noted in the Asbestos Survey Log (Appendix B). The condition was denoted as good, damaged, or significantly damaged. Current condition is a factor used to assess the potential for fiber release. Other factors used to determine potential fiber release include air movement, surface type, and area activity as related to human occupancy.

4.0 ANALYSIS AND RESULTS

4.1 Laboratory Analysis

Samples were analyzed by EMSL Analytical, Inc. using Polarized Light Microscopy (PLM) with Dispersion Staining Techniques (EPA Bulk Analysis Method 600/R-93/116). This method utilizes part of the bulk sample which is mounted on a slide and exposed to an oil of specific refractive index. This prepared slide is then subjected to a variety of optical tests.

Each type of asbestos displays unique characteristics when subjected to these tests. Percentages of asbestos content are then determined through visual estimating. Although this is an estimate, any material containing greater than one percent of any type of asbestos is classified as ACM by the EPA. Any material classified as ACM must be handled accordingly.

Under the revised South Carolina Asbestos Regulation 61-86.1 effective June 27, 2008, any analysis of non-friable organically bound (NOB) material that is found to be negative via PLM testing, must have confirmation testing via Transmission Electron Microscopy (TEM) on one sample from each medium; therefore, eight (8) samples were analyzed by the lab, via TEM testing.

4.2 Survey Results

Samples were collected and tested from various suspect materials, as referenced in Appendix B, Asbestos Sample Log. Samples of tan geometric sheet flooring, dark floral sheet flooring, red floral sheet flooring, green floral sheet flooring, mottled tan sheet flooring, window glaze, roofing shingles and roofing felt were verified as negative, via TEM analysis.

Appendix C contains a copy of the analytical results from the laboratory.

**TABLE 1
DILAPIDATED RESIDENTIAL STRUCTURE
208 WEST OAKLAND AVENUE
SUMTER, SOUTH CAROLINA
ASBESTOS-CONTAINING MATERIAL (ACM)**

Description	Location	Category (F/NF)	Approx. SF/LF
Tan with Stylized Red Design Sheet Flooring	Over Wood Floor Substrate in Second Floor Room 2C	NF – Cat. I – Good Condition	120 SF
Red-colored, Small Brick-design Sheet Flooring	Top Layer of Sheet Flooring in Second Floor Restroom RR-2	NF – Cat. I – Good Condition	55 SF
Mottled Yellowish Tan Sheet Flooring	Over Wood Floor Substrate in First Floor Room 1C	NF – Cat. I – Good Condition	165 SF
Roof Flashing Sealant	Junctions of Shingled Roof Areas with Exterior Walls	NF – Cat. I – Good Condition	110 LF
Chimney Flashing Sealant ⁽¹⁾	Penetration at the Upper Roof Area	Presumed to Contain Asbestos	10 LF

Note: F - Friable

NF - Non-Friable

(1) - The chimney flashing material at the upper roof chimney penetration could not be accessed for assessment and sample collection purposes; therefore, the sealant material is presumed to contain asbestos.

EMERALD, INC., CONDUCTED THE SURVEY TO THE BEST OF ITS ABILITY, ADHERING TO INDUSTRY STANDARDS. THE QUANTITIES PROVIDED IN THIS REPORT ARE APPROXIMATE AND SHALL SERVE AS A BASIS FOR ABATEMENT BID SUBMITTALS. IF ADDITIONAL SUSPECT MATERIALS ARE IDENTIFIED DURING RENOVATION OR DEMOLITION ACTIVITY, THE CONTRACTOR SHALL CEASE WORK AND NOTIFY THE BUILDING OWNER'S REPRESENTATIVE.

5.0 CONCLUSIONS AND RECOMMENDATIONS

Based upon the inspection of October 21, 2025, and the analytical results from the samples collected and tested by an independent laboratory, the dilapidated residential structure located at 208 W. Oakland Ave. in Sumter, S.C., does contain non-friable ACM, as per Table 1. Such materials will have to be removed and properly disposed of by a S.C. licensed abatement contractor per SCDES Bureau of Air Quality Asbestos Regulation 61-86.1 effective May 27, 2011, prior to demolition activities involving the asbestos-containing materials.

While portions of the residential structure are dilapidated, Mr. Reames was able to traverse the interior areas of the building that have asbestos-containing sheet flooring, as well as the roof areas with asbestos-containing flashing, without difficulty. Emerald, Inc., recommends that a licensed codes enforcement officer representing the City or County of Sumter, or a professional engineer, inspect the structure and, subsequently, generate an official letter that addresses any hazardous issues related to abatement or demolition personnel entering the building.

6.0 ASSUMPTIONS AND LIMITATIONS

The results, findings, conclusions and recommendations expressed in this report are based only on conditions that were observed during the inspection of October 21, 2025. Emerald, Inc., their representative and this report make no representation and/or assumptions as to past conditions or future occurrences. The information, conclusions and recommendations provided herein do not constitute as legal or medical advice. It is further understood that Emerald, Inc. makes no representations or warranties of any kind. Nor are such representations or warranties to be implied with respect to the data furnished. Emerald, Inc. assumes no responsibility with respect to the customers and its employees use thereof.

The information provided herein applies only to the subject property as it existed during Emerald, Inc.'s site visit. If this site's use and/or conditions change, information, observations and recommendations found herein would no longer apply. This report is intended to be used in its entirety. No excerpts may be taken to typify the findings of this survey. Emerald, Inc. shall not be liable for any special, consequential and/or exemplary damages resulting, in whole or in part, from the customer's use of the data provided. It was not within the scope of this investigation to remove surface materials to investigate portions of the structure or materials that lay beneath the surface. Our selection of sample locations and frequency is based upon our observations and the assumption that like materials in the same are homogeneous.

Emerald, Inc. conducted the survey to the best of its ability using the standards of the industry. In the event additional materials are found to contain asbestos, Emerald, Inc. shall not be liable for any failure of such findings during its initial survey.

EMSL maintains liability limited to cost of analysis. Interpretation and use of test results are the responsibility of the client. This report relates only to the samples reported above, and may not be reproduced, except in full, without written approval by EMSL. EMSL bears no responsibility for sample collection activities or analytical method limitations. The report reflects the samples as received. Results are generated from the field sampling data (sampling volumes and areas, locations, etc.) provided by the client on the Chain of Custody. Samples are within quality control criteria and met method specifications unless otherwise noted. EMSL recommends that samples reported as none detected or < 1% undergo additional analysis via PLM to avoid the possibility of false negatives.

EMSL maintains liability limited to cost of analysis. Interpretation and use of test results are the responsibility of the client. This report relates only to the samples reported above, and may not be reproduced, except in full, without written approval by EMSL. EMSL bears no responsibility for sample collection activities or analytical method limitations. The report reflects the samples as received. Results are generated from the field sampling data (sampling volumes and areas, locations, etc.) provided by the client on the Chain of Custody. Samples are within quality control criteria and met method specifications unless otherwise noted. The above analyses were performed in general compliance with Appendix E to Subpart E of 40 CFR (previously EPA 600/M-4-82-020 "Interim Method") but augmented with procedures outlined in the 1993 ("final") version of the method. This report must not be used by the client to claim product certification, approval, or endorsement by NVLAP, NIST or any agency of the federal government. Non-friable organically bound materials present a problem matrix and therefore EMSL recommends gravimetric reduction prior to analysis. Unless requested by the client, building materials manufactured with multiple layers (i.e. linoleum, wallboard, etc.) are reported as a single sample. Estimation of uncertainty is available on request.

Samples analyzed by EMSL Analytical, Inc. Kernersville, NC NVLAP Lab Code 102104-0, Virginia 3333-000228, West Virginia LT000321

Re: 208 W Oakland Ave.

Parcel # 227-04-01-032

The structure identified above is structurally compromised and unsafe to enter.

The asbestos will need to be abated through demolition.

Respectfully,

Woody Avins

Building Official

FOREWORD

This report was prepared by Emerald, Inc., of Sumter, South Carolina, for the City of Sumter regarding the dilapidated residential structure located at 396 Albert Dr. in Sumter, S.C. The contents of this report are confidential and intended for the use of the client only.

J. Dalton Reames, Jr., S.C. Licensed Building Inspector, conducted the inspection and prepared this report. Any questions or comments concerning this report should be directed to Dalton Reames or Chad McClary, President, at either (803) 469-5454 or via email at dreames@emeraldinc-us.com or cmcclary@emeraldinc-us.com, respectively.

J. Dalton Reames, Jr.

1.0 INTRODUCTION AND OBJECTIVE

Emerald, Inc. was requested to conduct an Asbestos Survey of the vacant residential structure located at 396 Albert Dr. in Sumter, S.C., to identify the presence of any asbestos-containing materials (ACM), prior to demolition activities. The inspection was authorized by Mr. John Macloskie, Codes Director, with the City of Sumter. The inspection included identification and assessment of the condition of suspect asbestos-containing materials, either friable or non-friable, on the interior and exterior portions of the structure.

This report is a compilation of the inspection and its results.

2.0 SURVEY METHODOLOGY

On October 28, 2025, Emerald, Inc. conducted an Asbestos Survey of the building at the stated location. J. Dalton Reames, Jr., South Carolina Licensed Building Inspector, conducted the inspection.

Constructed circa 1956 for residential purposes, the single-story structure contains approximately 945 square feet of interior space and was in dilapidated condition, at the time of the survey. Wood-framed walls and floors are built over an earthen crawlspace. The basic building components are as follows:

- Exterior Walls
 - Transite siding and associated vapor felt over diagonal wood slats of the original structure
 - Wood panels over wood framework in the southeast Add-on Room
- Wooden, A-framed roof covered with shingles and felt
- Wood floor substrate attached to wood joists
 - Sheet flooring in Kitchen, otherwise uncovered

- Wood-framed Interior Walls (Significantly Damaged Condition)
 - Sheetrock system attached to wood framework of original structure
 - Wood paneling over wood framework in the Add-on Room
- Ceilings (Significantly Damaged Condition)
 - Sheetrock attached to wooden joists in original structure
 - Wood planks attached to wooden joists in the Add-on Room
- Climate Control Equipment
 - Dismantled, ground-mounted compressor
 - Foil-wrapped, fiberglass-insulated ductwork in crawlspace
 - Floor-mounted air handling equipment (former furnace space)

Future use of the property, following demolition activities, is unknown.

The survey included a visual inspection to identify the presence of materials suspected of containing asbestos. This identification was based on the experience and training of the inspector. A total of twenty-six (26) samples were collected during the survey for laboratory analysis, based upon the required EPA and South Carolina Department of Environmental Services (SCDES) sampling matrix. Samples were placed in individual containers, labeled and numbered according to the sampling scheme (396-1 through 396-26). Per SCDES Asbestos Regulations, the independent laboratory is required to analyze all layers of each sample. As a result of some sample materials containing multiple layers that were identified by the laboratory (e.g. sheetrock with joint compound and tape layers) twenty-three (23) samples were analyzed by the lab, via Polarized Light Microscopy (PLM) while utilizing Positive Stop, and five (5) samples were analyzed, via Transmission Electron Microscopy (TEM). Appendix B contains the Asbestos Survey Log kept during the inspection which identifies the samples collected by

sample number, sample type, location and condition assessment, along with any comments. The samples were shipped to EMSL Analytical, Inc. in Kernersville, North Carolina for analysis. Analysis and results are discussed in Section 4.0.

3.0 HAZARD ASSESSMENT FACTORS (ASBESTOS)

3.1 Homogeneous Areas

The sample collection was typically conducted by homogeneous materials, i.e., any materials of the same type regarding uniformity throughout in structure or make-up and appearance (color, texture, and/or date of construction/application). Homogeneous materials can be further classified as surfacing materials, thermal system insulation and miscellaneous materials. Miscellaneous materials include ceiling tiles, floor tiles, roofing, caulking, and glazing, etc.

3.2 Hazard Factors

The samples of suspect material collected were classified as either friable (F) or non-friable (NF). Friable means the material can be crumbled, pulverized, or reduced to powder by ordinary hand pressure. Materials initially determined to be non-friable can receive a reclassification of friable if the material is damaged, thereby providing an avenue for release of asbestos fibers. Friable asbestos-containing material (ACM) has been determined by EPA and OSHA to be a greater hazard (health risk) than non-friable ACM. In assessing the fiber release potential, the current condition of the suspect materials sampled was noted in the Asbestos Survey Log (Appendix B). The condition was denoted as good, damaged, or significantly damaged. Current condition is a factor used to assess the potential for fiber release. Other factors used to determine potential fiber release include air movement, surface type, and area activity as related to human occupancy.

4.0 ANALYSIS AND RESULTS

4.1 Laboratory Analysis

Samples were analyzed by EMSL Analytical, Inc. using Polarized Light Microscopy (PLM) with Dispersion Staining Techniques (EPA Bulk Analysis Method 600/R-93/116). This method utilizes part of the bulk sample which is mounted on a slide and exposed to an oil of specific refractive index. This prepared slide is then subjected to a variety of optical tests.

Each type of asbestos displays unique characteristics when subjected to these tests. Percentages of asbestos content are then determined through visual estimating. Although this is an estimate, any material containing greater than one percent of any type of asbestos is classified as ACM by the EPA. Any material classified as ACM must be handled accordingly.

Under the revised South Carolina Asbestos Regulation 61-86.1 effective June 27, 2008, any analysis of non-friable organically bound (NOB) material that is found to be negative via PLM testing, must have confirmation testing via Transmission Electron Microscopy (TEM) on one sample from each medium; therefore, five (5) samples were analyzed by the lab, via TEM testing.

4.2 Survey Results

Samples were collected and tested from various suspect materials, as referenced in Appendix B, Asbestos Sample Log. Samples of roof shingles, roofing felt and sheet flooring were verified as negative, via TEM analysis.

- <0.1% asbestos detected in exterior wall felt, via TEM analysis.
- <0.19% asbestos detected in window glaze, via TEM analysis.

Appendix C contains a copy of the analytical results from the laboratory.

TABLE 1
DILAPIDATED RESIDENTIAL STRUCTURE
396 ALBERT DRIVE
SUMTER, SOUTH CAROLINA
ASBESTOS-CONTAINING MATERIAL (ACM) ⁽¹⁾

Description	Location	Category (F/NF)	Approx. SF/LF
Transite Exterior Siding	Exterior Walls of the Original Building Structure, including Former Exterior Wall inside the Add-on Room	NF – Cat. II – Good Condition	1,160 SF
Sheetrock with Joint Compound Wall and Ceiling System	Ceilings, Walls and Debris Piles of the Original Building Structure (Excluding Add-on Room)	F – Significantly Damaged Condition	3,200 SF

Note: F - Friable
 NF - Non-Friable

(1) - "Asbestos-containing Material (ACM)" is defined by SCDES and the EPA as material containing asbestos of any type, either alone or mixed with other materials, in an amount greater than one percent (>1%).

EMERALD, INC., CONDUCTED THE SURVEY TO THE BEST OF ITS ABILITY, ADHERING TO INDUSTRY STANDARDS. THE QUANTITIES PROVIDED IN THIS REPORT ARE APPROXIMATE AND SHALL SERVE AS A BASIS FOR ABATEMENT BID SUBMITTALS. IF ADDITIONAL SUSPECT MATERIALS ARE IDENTIFIED DURING RENOVATION OR DEMOLITION ACTIVITY, THE CONTRACTOR SHALL CEASE WORK AND NOTIFY THE BUILDING OWNER'S REPRESENTATIVE.

5.0 CONCLUSIONS AND RECOMMENDATIONS

Based upon the inspection of October 28, 2025, and the analytical results from the samples collected and tested by an independent laboratory, the dilapidated residential structure located at 396 Albert Dr. in Sumter, S.C., does contain friable and non-friable ACM, as per Table 1. Such materials will have to be removed and properly disposed of by a S.C. licensed abatement contractor per SCDES Bureau of Air Quality Asbestos Regulation 61-86.1 effective May 27, 2011, prior to demolition activities involving the asbestos-containing materials.

Whereas the residential structure is in dilapidated condition, and the significantly damaged sheetrock system is asbestos-containing, Emerald, Inc., concludes that the entire structure, with approximately 3,300 cubic feet of building materials, is contaminated with regulated asbestos-containing materials (RACM). It is recommended that a licensed codes enforcement officer representing the City or County of Sumter, or a professional engineer, inspect the structure and, subsequently, generate an official letter that states the dilapidated conditions, to facilitate SCDES licensing requirements regarding outdoor demolition activities with regulated asbestos-containing materials.

6.0 ASSUMPTIONS AND LIMITATIONS

The results, findings, conclusions and recommendations expressed in this report are based only on conditions that were observed during the inspection of October 28, 2025. Emerald, Inc., their representative and this report make no representation and/or assumptions as to past conditions or future occurrences. The information, conclusions and recommendations provided herein do not constitute as legal or medical advice. It is further understood that Emerald, Inc. makes no representations or warranties of any kind. Nor are such representations or warranties to be implied with respect to the data furnished. Emerald, Inc. assumes no responsibility with respect to the customers and its employees use thereof.

The information provided herein applies only to the subject property as it existed during Emerald, Inc.'s site visit. If this site's use and/or conditions change, information, observations and recommendations found herein would no longer apply. This report is intended to be used in its entirety. No excerpts may be taken to typify the findings of this survey. Emerald, Inc. shall not be liable for any special, consequential and/or exemplary damages resulting, in whole or in part, from the customer's use of the data provided. It was not within the scope of this investigation to remove surface materials to investigate portions of the structure or materials that lay beneath the surface. Our selection of sample locations and frequency is based upon our observations and the assumption that like materials in the same are homogeneous.

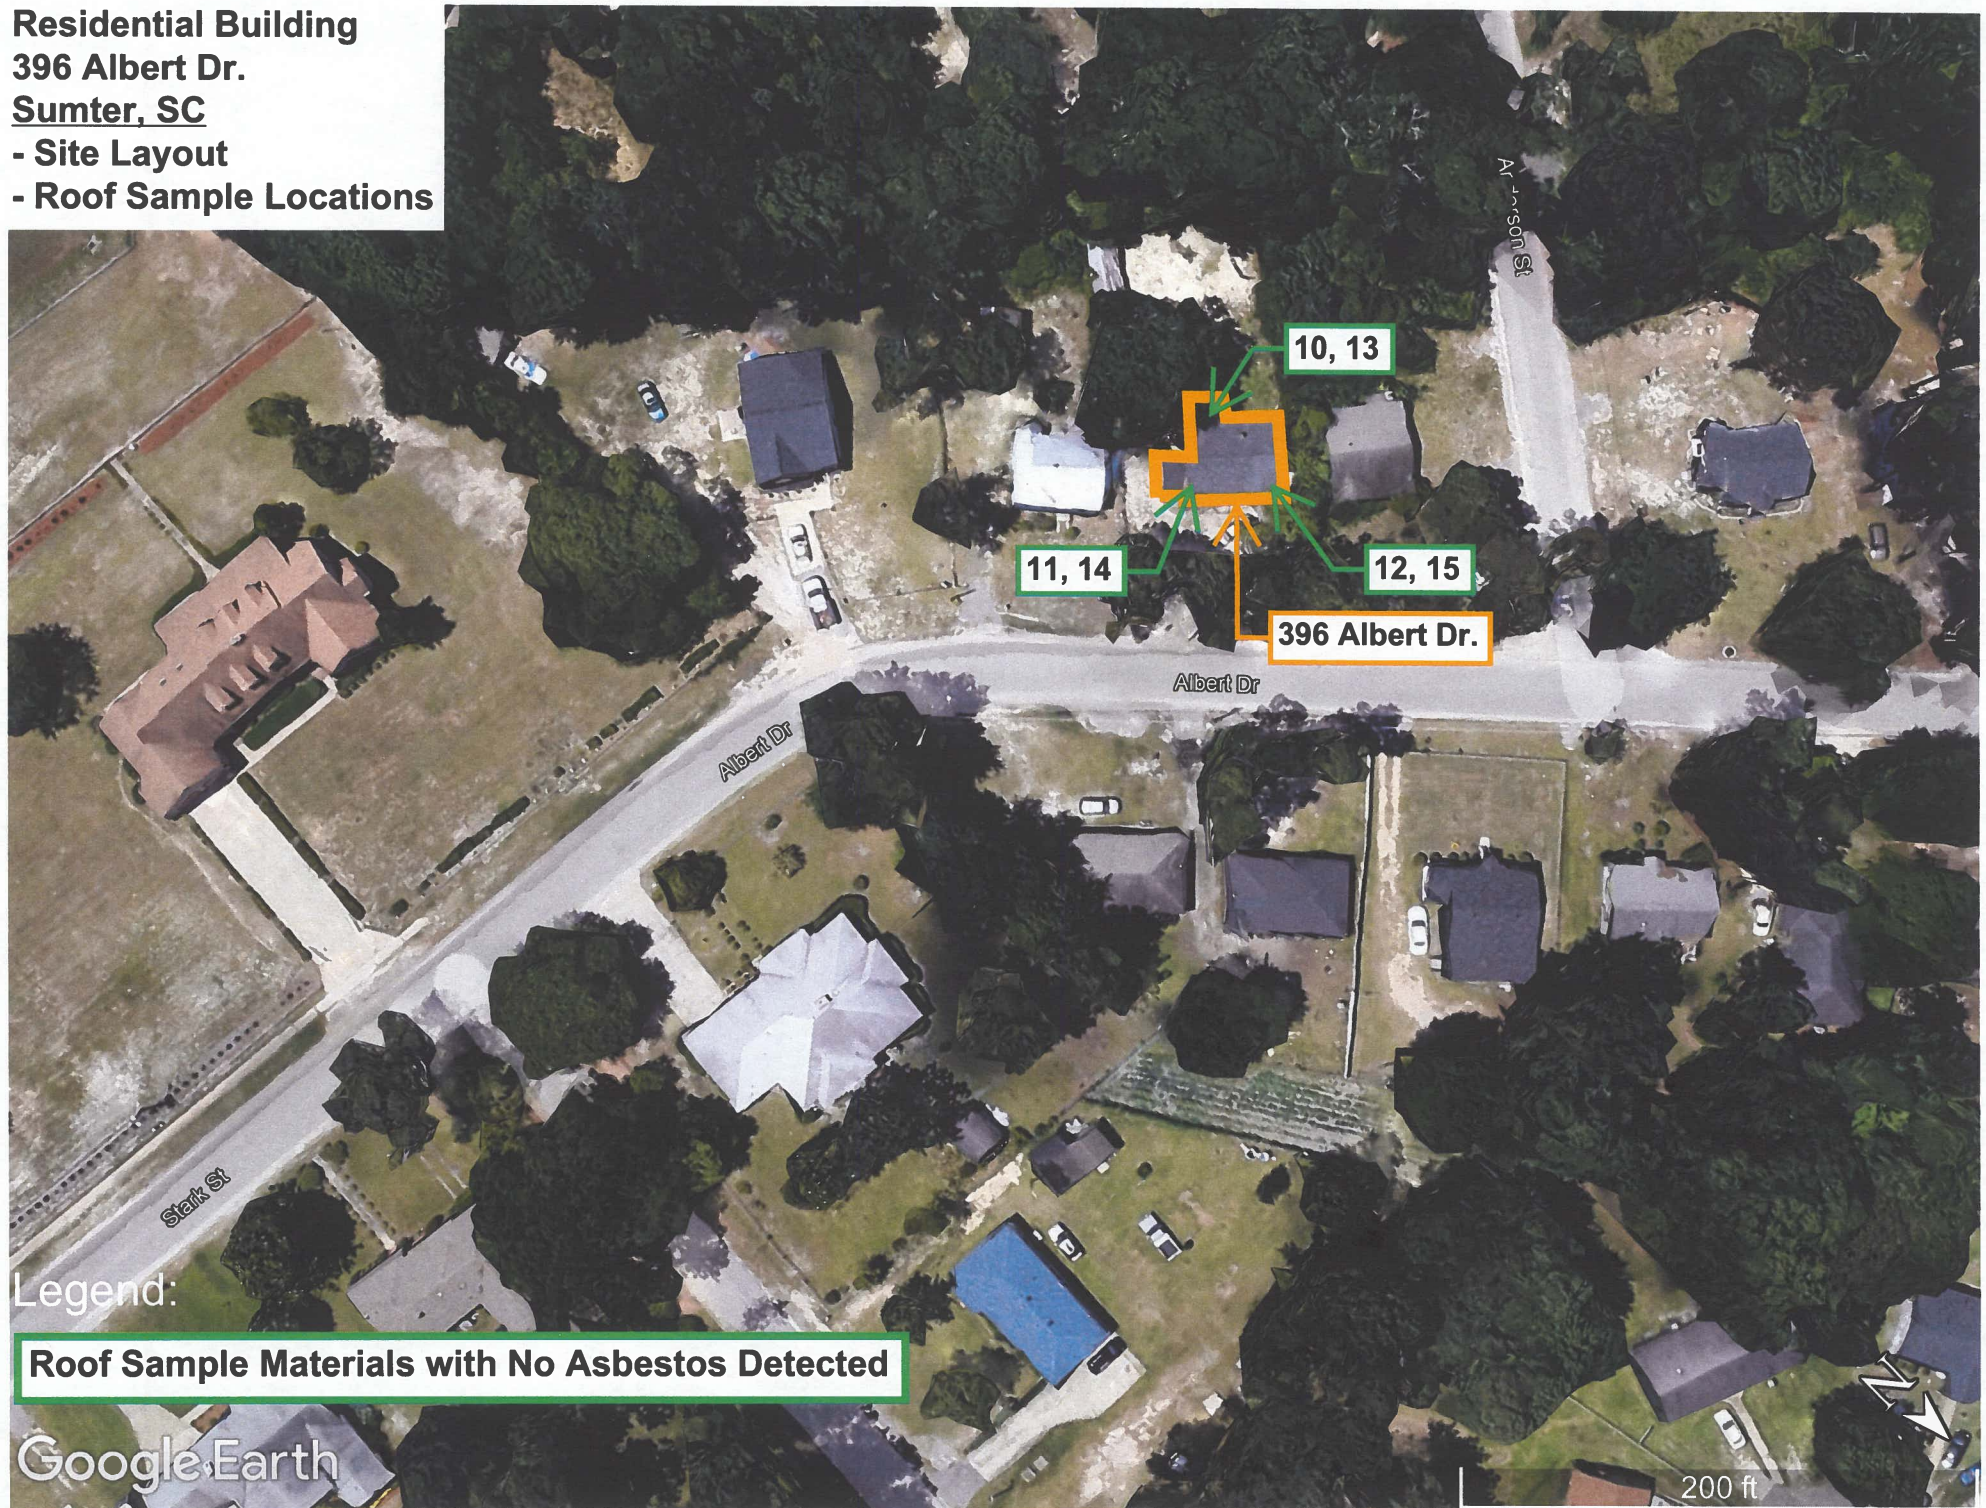

Emerald, Inc. conducted the survey to the best of its ability using the standards of the industry. In the event additional materials are found to contain asbestos, Emerald, Inc. shall not be liable for any failure of such findings during its initial survey.

EMSL maintains liability limited to cost of analysis. Interpretation and use of test results are the responsibility of the client. This report relates only to the samples reported above, and may not be reproduced, except in full, without written approval by EMSL. EMSL bears no responsibility for sample collection activities or analytical method limitations. The report reflects the samples as received. Results are generated from the field sampling data (sampling volumes and areas, locations, etc.) provided by the client on the Chain of Custody. Samples are within quality control criteria and met method specifications unless otherwise noted. EMSL recommends that samples reported as none detected or <1% undergo additional analysis via PLM to avoid the possibility of false negatives.

EMSL maintains liability limited to cost of analysis. Interpretation and use of test results are the responsibility of the client. This report relates only to the samples reported above, and may not be reproduced, except in full, without written approval by EMSL. EMSL bears no responsibility for sample collection activities or analytical method limitations. The report reflects the samples as received. Results are generated from the field sampling data (sampling volumes and areas, locations, etc.) provided by the client on the Chain of Custody. Samples are within quality control criteria and met method specifications unless otherwise noted. The above analyses were performed in general compliance with Appendix E to Subpart E of 40 CFR (previously EPA 600/M4-82-020 "Interim Method") but augmented with procedures outlined in the 1993 ("final") version of the method. This report must not be used by the client to claim product certification, approval, or endorsement by NVLAP, NIST or any agency of the federal government. Non-friable organically bound materials present a problem matrix and therefore EMSL recommends gravimetric reduction prior to analysis. Unless requested by the client, building materials manufactured with multiple layers (i.e. linoleum, wallboard, etc.) are reported as a single sample. Estimation of uncertainty is available on request.

Re: 396 Albert Dr.

Parcel # 229-11-05-003

The structure identified above is structurally compromised and unsafe to enter.

The asbestos will need to be abated through demolition.

Respectfully,

Woody Avins

Building Official

FOREWORD

This report was prepared by Emerald, Inc. of Sumter, South Carolina, for the City of Sumter, regarding the dilapidated residential building and associated storage building located at 434 Council St. in Sumter, S.C. The contents of this report are confidential and intended for the use of the client only.

J. Dalton Reames, Jr., S.C. Licensed Building Inspector, conducted the inspection, and Ronny L. Lowder, S.C. Licensed Building Inspector and Management Planner, prepared this report. Any questions or comments concerning this report should be directed to Ronny L. Lowder at either (803) 469-5454 or via email at rlowder@emeraldinc-us.com.

1.0 INTRODUCTION AND OBJECTIVE

Emerald, Inc. was requested to conduct an Asbestos Survey of the vacant residential structure located at 434 Council St. in Sumter, S.C., to identify the presence of any asbestos-containing materials (ACM), prior to demolition activities. The inspection was authorized by Mr. John Macloskie, Codes Director, with the City of Sumter. The inspection included identification and assessment of the condition of suspect asbestos-containing materials, either friable or non-friable, on the interior and exterior portions of the structure.

This report is a compilation of the inspection and its results.

2.0 SURVEY METHODOLOGY

On January 14, 2025, Emerald, Inc. conducted an Asbestos Survey on the residential building, as well as the standalone shed structure, at the stated address. J. Dalton Reames, Jr., South Carolina Licensed Building Inspector, conducted the inspection.

Estimated to have been constructed circa 1945 for residential purposes, the single-story residential structure contains approximately 800 square feet of interior space and was in a dilapidated state, at the time of the survey. The basic building construction is as follows:

- Wood-framed Walls Built over an Earthen Crawl Space
- Wood Slat Exterior Walls
- Wooden A-framed Roof Structure
 - Covered with Sheet Metal Panels
- Hardwood Flooring Substrate
 - Resilient Sheeting and Floor Square Coverings

- Interior Walls Covered by Sheetrock with Joint Compound
- Wood Slat Ceilings
 - Sheetrock over Slats in Room C
- No Climate-control Equipment Was Present
- Standalone Storage Shed, measuring approximately 10' x 8', is Wood Framed
 - Plywood Flooring
 - Fiberboard Wall Panels
 - Shingles over A-framed Roof Structure

Future use of the property, following demolition activities, is unknown.

The survey included a visual inspection to identify the presence of material suspected of containing asbestos. This identification was based on the experience and training of the inspector. A total of thirty-two (32) samples were collected during the survey for laboratory analysis, based upon the required EPA and South Carolina Department of Environmental Services (SCDES) sampling matrix. Samples were placed in individual containers, labeled and numbered according to the sampling schemes (434-1 through 434-32). Per SCDES Asbestos Regulations, the independent laboratory is required to sample all layers of each sample. As a result, twenty-seven (27) samples were analyzed by the lab, via Polarized Light Microscopy (PLM) while utilizing Positive Stop, and four (4) samples were analyzed, via Transmission Electron Microscopy (TEM). Appendix B contains the Asbestos Survey Log kept during the inspection which identifies the samples collected by sample number, sample type, location and condition assessment, along with any comments. The samples were shipped to EMSL Analytical, Inc. in Kernersville, North Carolina for analysis. Analysis and results are discussed in Section 4.0.

3.0 HAZARD ASSESSMENT FACTORS (ASBESTOS)

3.1 Homogeneous Areas

The sample collection was typically conducted by homogeneous materials, i.e., any materials of the same type regarding uniformity throughout in structure or make-up and appearance (color, texture, and/or date of construction/application). Homogeneous materials can be further classified as surfacing materials, thermal system insulation and miscellaneous materials. Miscellaneous materials include ceiling tiles, floor tiles, roofing, caulking, and glazing, etc.

3.2 Hazard Factors

The samples of suspect material collected were classified as either friable (F) or non-friable (NF). Friable means the material can be crumbled, pulverized, or reduced to powder by ordinary hand pressure. Materials initially determined to be non-friable can receive a reclassification of friable if the material is damaged, thereby providing an avenue for release of asbestos fibers. Friable asbestos-containing material (ACM) has been determined by EPA and OSHA to be a greater hazard (health risk) than non-friable ACM. In assessing the fiber release potential, the current condition of the suspect materials sampled was noted in the Asbestos Survey Log (Appendix B). The condition was denoted as good, damaged, or significantly damaged. Current condition is a factor used to assess the potential for fiber release. Other factors used to determine potential fiber release include air movement, surface type, and area activity as related to human occupancy.

4.0 ANALYSIS AND RESULTS

4.1 Laboratory Analysis

Bulk samples were analyzed by EMSL Analytical, Inc. using Polarized Light Microscopy (PLM) with Dispersion Staining Techniques (EPA Bulk Analysis Method 600/R-93/116). This method utilizes part of the bulk sample which is mounted on a slide and exposed to an oil of specific refractive index. This prepared slide is then subjected to a variety of optical tests.

Each type of asbestos displays unique characteristics when subjected to these tests. Percentages of asbestos content are then determined through visual estimating. Although this is an estimate, any material containing greater than one percent of any type of asbestos is classified as ACM by the EPA. Any material classified as ACM must be handled accordingly.

Under the revised South Carolina Asbestos Regulation 61-86.1 effective June 27, 2008, any analysis of non-friable organically bound (NOB) material that is found to be negative via PLM testing, must have confirmation testing via Transmission Electron Microscopy (TEM) on one sample from each media; therefore, four (4) samples were analyzed by the lab, via TEM testing.

4.2 Survey Results

Samples were collected and tested from various suspect materials, as referenced in Appendix B, Asbestos Sample Log. Samples of parquet-design flooring squares, marbled green flooring squares, window caulk and Shed roof shingles were verified as negative, via TEM analysis.

Appendix C contains a copy of the analytical results from the laboratory.
of the analytical results from the laboratory.

EMERALD, INC., CONDUCTED THE SURVEY TO THE BEST OF ITS ABILITY, ADHERING TO INDUSTRY STANDARDS. THE QUANTITIES PROVIDED IN THIS REPORT ARE APPROXIMATE AND SHALL SERVE AS A BASIS FOR ABATEMENT BID SUBMITTALS. IF ADDITIONAL SUSPECT MATERIALS ARE IDENTIFIED DURING RENOVATION OR DEMOLITION ACTIVITY, THE CONTRACTOR SHALL CEASE WORK AND NOTIFY THE BUILDING OWNER'S REPRESENTATIVE.

5.0 CONCLUSIONS AND RECOMMENDATIONS

Based upon the inspection of January 14, 2025, and the analytical results from the samples collected and tested by an independent laboratory, the dilapidated residential building located at 434 Council St. in Sumter, S.C., does contain friable and non-friable ACM, as per Table 1. Such materials will have to be removed and properly disposed by a S.C. licensed abatement contractor per SCDES Bureau of Air Quality Asbestos Regulation 61-86.1 effective May 27, 2011, prior to demolition activities involving the asbestos-containing materials.

6.0 ASSUMPTIONS AND LIMITATIONS

The results, findings, conclusions and recommendations expressed in this report are based only on conditions that were observed during the inspection of January 14, 2025. Emerald, Inc., their representative and this report make no representation and/or assumptions as to past conditions or future occurrences. The information, conclusions and recommendations provided herein do not constitute as legal or medical advice. It is further understood that Emerald, Inc. makes no representations or warranties of any kind. Nor are such representations or warranties to be implied with respect to the data furnished. Emerald, Inc. assumes no responsibility with respect to the customers and its employees use thereof.

The information provided herein applies only to the subject property as it existed during Emerald, Inc.'s site visit. If this site's use and/or conditions change, information, observations and recommendations found herein would no longer apply. This report is intended to be used in its entirety. No excerpts may be taken to typify the findings of this survey. Emerald, Inc. shall not be liable for any special, consequential and/or exemplary damages resulting, in whole or in part, from the customer's use of the data provided. It was not within the scope of this investigation to remove surface materials to investigate portions of the structure or materials that lay beneath the surface. Our selection of sample locations and frequency is based upon our observations and the assumption that like materials in the same are homogeneous.

Emerald, Inc. conducted the survey to the best of its ability using the standards of the industry. In the event additional materials are found to contain asbestos, Emerald, Inc. shall not be liable for any failure of such findings during its initial survey.

EMSL maintains liability limited to cost of analysis. Interpretation and use of test results are the responsibility of the client. This report relates only to the samples reported above, and may not be reproduced, except in full, without written approval by EMSL. EMSL bears no responsibility for sample collection activities or analytical method limitations. The report reflects the samples as received. Results are generated from the field sampling data (sampling volumes and areas, locations, etc.) provided by the client on the Chain of Custody. Samples are within quality control criteria and met method specifications unless otherwise noted. The above analyses were performed in general compliance with Appendix E to Subpart E of 40 CFR (previously EPA 600/M4-82-020 "Interim Method") but augmented with procedures outlined in the 1993 ("final") version of the method. This report must not be used by the client to claim product certification, approval, or endorsement by NVLAP, NIST or any agency of the federal government. Non-friable organically bound materials present a problem matrix and therefore EMSL recommends gravimetric reduction prior to analysis. Unless requested by the client, building materials manufactured with multiple layers (i.e. linoleum, wallboard, etc.) are reported as a single sample. Estimation of uncertainty is available on request.

Samples analyzed by EMSL Analytical, Inc. Kernersville, NC NVLAP Lab Code 102104-0, Virginia 3333-000228, West Virginia LT000321

EMSL maintains liability limited to cost of analysis. Interpretation and use of test results are the responsibility of the client. This report relates only to the samples reported above, and may not be reproduced, except in full, without written approval by EMSL. EMSL bears no responsibility for sample collection activities or analytical method limitations. The report reflects the samples as received. Results are generated from the field sampling data (sampling volumes and areas, locations, etc.) provided by the client on the Chain of Custody. Samples are within quality control criteria and met method specifications unless otherwise noted. The above analyses were performed in general compliance with Appendix E to Subpart E of 40 CFR (previously EPA 600/M4-82-020 "Interim Method") but augmented with procedures outlined in the 1993 ("final") version of the method. This report must not be used by the client to claim product certification, approval, or endorsement by NVLAP, NIST or any agency of the federal government. Non-friable organically bound materials present a problem matrix and therefore EMSL recommends gravimetric reduction prior to analysis. Unless requested by the client, building materials manufactured with multiple layers (i.e. linoleum, wallboard, etc.) are reported as a single sample. Estimation of uncertainty is available on request.

Samples analyzed by EMSL Analytical, Inc. Kernersville, NC NVLAP Lab Code 102104-0, Virginia 3333-000228, West Virginia LT000321

1.0 INTRODUCTION AND OBJECTIVE

Emerald, Inc. was requested to conduct an Asbestos Survey of the vacant residential structure located at 534 S. Main St. in Sumter, S.C., to identify the presence of any asbestos-containing materials (ACM), prior to demolition activities. The inspection was authorized by Mr. John Macloskie, Codes Director, with the City of Sumter. The inspection included identification and assessment of the condition of suspect asbestos-containing materials, either friable or non-friable, on the interior and exterior portions of the structure.

This report is a compilation of the inspection and its results.

2.0 SURVEY METHODOLOGY

On October 20, 2025, Emerald, Inc. conducted an Asbestos Survey of the building at the stated location. J. Dalton Reames, Jr., South Carolina Licensed Building Inspector, conducted the inspection.

Constructed circa 1930 for residential purposes, the single-story structure contains approximately 1,204 square feet of interior space and was in hazardous condition, at the time of the survey. Wood-framed walls and floors are built over an earthen crawlspace. The basic building components are as follows:

- Wood-framed Exterior Walls
 - Aluminum and Vinyl Cladding over Wood Planks
 - Fiberboard Planks over Wood Framing
- Roofing Components in Dilapidated Condition
 - Wooden, A-framed Section Covered with Sheet Metal Panels and Associated Felt Paper
 - Wood-framed Sections with Asphaltic Shingles and Felt Paper

- Wood Floor Substrate attached to Wood Joists in Dilapidated Condition
 - Many Areas Contaminated with Asbestos-containing Ceiling Texture Debris Piles, Obscuring the View of the Entire Floor Area
 - Asbestos-containing 9 x 9 Floor Tiles
 - Asbestos-containing Sheet Flooring Scattered among Debris
- Wood-framed Interior Walls
 - Fiberboard Panel Sections
 - Sheetrock with Joint Compound Section
- Wood Ceiling Joists with Wood Slat Ceiling Substrate
 - Sheetrock Sections with Asbestos-containing, Spray-applied and Stippled Surfacing
 - Fiberboard Sections
 - Uncovered Wood Slat Sections
- Climate Control Equipment
 - Brick Chimney Observed; however, it was Inaccessible
 - Roof Flashing Sealant is Presumed to Contain Asbestos

Future use of the property, following demolition activities, is unknown.

The survey included a visual inspection to identify the presence of materials suspected of containing asbestos. This identification was based on the experience and training of the inspector. A total of thirty-nine (39) samples were collected during the survey for laboratory analysis, based upon the required EPA and South Carolina Department of Environmental Services (SCDES) sampling matrix. Samples were placed in individual containers, labeled and numbered according to the sampling scheme (534-1 through 534-39). Per SCDES Asbestos Regulations, the independent laboratory is

required to analyze all layers of each sample. As a result of some sample materials containing multiple layers that were identified by the laboratory (e.g. sheetrock with joint compound and multi-layered flooring materials), thirty-six (36) samples were analyzed by the lab, via Polarized Light Microscopy (PLM) while utilizing Positive Stop, and six (6) samples were analyzed, via Transmission Electron Microscopy (TEM). Appendix B contains the Asbestos Survey Log kept during the inspection which identifies the samples collected by sample number, sample type, location and condition assessment, along with any comments. The samples were shipped to EMSL Analytical, Inc. in Kernersville, North Carolina for analysis. Analysis and results are discussed in Section 4.0.

3.0 HAZARD ASSESSMENT FACTORS (ASBESTOS)

3.1 Homogeneous Areas

The sample collection was typically conducted by homogeneous materials, i.e., any materials of the same type regarding uniformity throughout in structure or make-up and appearance (color, texture, and/or date of construction/application). Homogeneous materials can be further classified as surfacing materials, thermal system insulation and miscellaneous materials. Miscellaneous materials include ceiling tiles, floor tiles, roofing, caulking, and glazing, etc.

3.2 Hazard Factors

The samples of suspect material collected were classified as either friable (F) or non-friable (NF). Friable means the material can be crumbled, pulverized, or reduced to powder by ordinary hand pressure. Materials initially determined to be non-friable can receive a reclassification of friable if the material is damaged, thereby providing an avenue for release of asbestos fibers. Friable asbestos-containing material (ACM) has been determined by EPA and OSHA to be a greater hazard (health risk) than non-friable

ACM. In assessing the fiber release potential, the current condition of the suspect materials sampled was noted in the Asbestos Survey Log (Appendix B). The condition was denoted as good, damaged, or significantly damaged. Current condition is a factor used to assess the potential for fiber release. Other factors used to determine potential fiber release include air movement, surface type, and area activity as related to human occupancy.

4.0 ANALYSIS AND RESULTS

4.1 Laboratory Analysis

Samples were analyzed by EMSL Analytical, Inc. using Polarized Light Microscopy (PLM) with Dispersion Staining Techniques (EPA Bulk Analysis Method 600/R-93/116). This method utilizes part of the bulk sample which is mounted on a slide and exposed to an oil of specific refractive index. This prepared slide is then subjected to a variety of optical tests.

Each type of asbestos displays unique characteristics when subjected to these tests. Percentages of asbestos content are then determined through visual estimating. Although this is an estimate, any material containing greater than one percent of any type of asbestos is classified as ACM by the EPA. Any material classified as ACM must be handled accordingly.

Under the revised South Carolina Asbestos Regulation 61-86.1 effective June 27, 2008, any analysis of non-friable organically bound (NOB) material that is found to be negative via PLM testing, must have confirmation testing via Transmission Electron Microscopy (TEM) on one sample from each medium; therefore, six (6) samples were analyzed by the lab, via TEM testing.

4.2 Survey Results

Samples were collected and tested from various suspect materials, as referenced in Appendix B, Asbestos Sample Log. Samples of roofing felts, mottled green and gray roof shingles, green roof shingles, window glaze, and brown mastic associated with asbestos-containing 9 x 9 floor tiles were verified as negative, via TEM analysis.

**TABLE 1
DILAPIDATED RESIDENTIAL STRUCTURE
534 SOUTH MAIN STREET
SUMTER, SOUTH CAROLINA
REGULATED ASBESTOS-CONTAINING MATERIAL (RACM)**

Description	Location	Category (F/NF)	Approx. SF/LF
Silver Roof Sealant	Surface of Sheet Metal Roof Panels	F – Significantly Damaged Condition	905 SF
Black Roof Seam Sealant	Junction of Sheet Metal Roof System with Shingled Roof System	F – Damaged Condition	100 LF
9x9 Floor Tiles with Various Design Features	Interior Floor Areas – Extent Unknown, due to Debris Obscuring Floor Areas*	F – Damaged Condition	300 SF*
Tan, Stylized Sheet Flooring	Scattered among Floor Areas, Debris Piles and in the Crawlspace – Extent Unknown*	F – Damaged Condition	900 SF*
Spray-applied Ceiling Texture	Remnant Ceilings and Debris Piles – Exact Extent Unknown*	F – Significantly Damaged Condition	604 SF*
Stippled Ceiling Texture	Remnant Ceilings and Debris Piles – Exact Extent Unknown*	F – Significantly Damaged Condition	600 SF*
Chimney Roof Flashing (Inaccessible)	Penetration Base with Roof	F – Presumed to Contain Asbestos	12 LF

Note: F - Friable
NF - Non-Friable

EMERALD, INC., CONDUCTED THE SURVEY TO THE BEST OF ITS ABILITY, ADHERING TO INDUSTRY STANDARDS. THE QUANTITIES PROVIDED IN THIS REPORT ARE APPROXIMATE AND SHALL SERVE AS A BASIS FOR ABATEMENT BID SUBMITTALS. IF ADDITIONAL SUSPECT MATERIALS ARE IDENTIFIED DURING RENOVATION OR DEMOLITION ACTIVITY, THE CONTRACTOR SHALL CEASE WORK AND NOTIFY THE BUILDING OWNER'S REPRESENTATIVE.

5.0 CONCLUSIONS AND RECOMMENDATIONS

Based upon the inspection of October 20, 2025, and the analytical results from the samples collected and tested by an independent laboratory, the dilapidated residential structure located at 534 S. Main St. in Sumter, S.C., does contain friable RACM, as per Table 1. Such materials will have to be removed and properly disposed of by a S.C. licensed abatement contractor per SCDES Bureau of Air Quality Asbestos Regulation 61-86.1 effective May 27, 2011, prior to demolition activities involving the asbestos-containing materials.

Whereas the residential structure is in hazardous condition with damaged and significantly damaged asbestos-containing components, Emerald, Inc., concludes that the entire structure, with approximately 4,870 cubic feet of building materials, is contaminated with regulated asbestos-containing material (RACM). It is recommended that a licensed codes enforcement officer representing the City or County of Sumter, or a professional engineer, inspect the structure and, subsequently, generate an official letter that states the hazardous conditions, to facilitate SCDES licensing requirements regarding outdoor demolition activities with regulated asbestos-containing materials.

6.0 ASSUMPTIONS AND LIMITATIONS

The results, findings, conclusions and recommendations expressed in this report are based only on conditions that were observed during the inspection of October 20, 2025. Emerald, Inc., their representative and this report make no representation and/or assumptions as to past conditions or future occurrences. The information, conclusions and recommendations provided herein do not constitute as legal or medical advice. It is further understood that Emerald, Inc. makes no representations or warranties of any kind. Nor are such representations or warranties to be implied with respect to the data furnished. Emerald, Inc. assumes no responsibility with respect to the customers and its employees use thereof.

The information provided herein applies only to the subject property as it existed during Emerald, Inc.'s site visit. If this site's use and/or conditions change, information, observations and recommendations found herein would no longer apply. This report is intended to be used in its entirety. No excerpts may be taken to typify the findings of this survey. Emerald, Inc. shall not be liable for any special, consequential and/or exemplary damages resulting, in whole or in part, from the customer's use of the data provided. It was not within the scope of this investigation to remove surface materials to investigate portions of the structure or materials that lay beneath the surface. Our selection of sample locations and frequency is based upon our observations and the assumption that like materials in the same are homogeneous.

Emerald, Inc. conducted the survey to the best of its ability using the standards of the industry. In the event additional materials are found to contain asbestos, Emerald, Inc. shall not be liable for any failure of such findings during its initial survey.

EMSL maintains liability limited to cost of analysis. Interpretation and use of test results are the responsibility of the client. This report relates only to the samples reported above, and may not be reproduced, except in full, without written approval by EMSL. EMSL bears no responsibility for sample collection activities or analytical method limitations. The report reflects the samples as received. Results are generated from the field sampling data (sampling volumes and areas, locations, etc.) provided by the client on the Chain of Custody. Samples are within quality control criteria and met method specifications unless otherwise noted. The above analyses were performed in general compliance with Appendix E to Subpart E of 40 CFR (previously EPA 600/M4-82-020 "Interim Method") but augmented with procedures outlined in the 1993 ("final") version of the method. This report must not be used by the client to claim product certification, approval, or endorsement by NVLAP, NIST or any agency of the federal government. Non-friable organically bound materials present a problem matrix and therefore EMSL recommends gravimetric reduction prior to analysis. Unless requested by the client, building materials manufactured with multiple layers (i.e. linoleum, wallboard, etc.) are reported as a single sample. Estimation of uncertainty is available on request.

1.0 INTRODUCTION AND OBJECTIVE

Emerald, Inc. was requested to conduct an Asbestos Survey of the vacant residential structure located at 548 S. Main St. in Sumter, S.C., to identify the presence of any asbestos-containing materials (ACM), prior to demolition activities. The inspection was authorized by Mr. John Macloskie, Codes Director, with the City of Sumter. The inspection included identification and assessment of the condition of suspect asbestos-containing materials, either friable or non-friable, on the interior and exterior portions of the structure.

This report is a compilation of the inspection and its results.

2.0 SURVEY METHODOLOGY

On October 20, 2025, Emerald, Inc. conducted an Asbestos Survey of the building at the stated location. J. Dalton Reames, Jr., South Carolina Licensed Building Inspector, conducted the inspection.

Constructed circa 1930 for residential purposes, the single-story structure contains approximately 1,086 square feet of interior space and was in dilapidated condition, at the time of the survey. Wood-framed walls and floors are built over an earthen crawlspace. The basic building components are as follows:

- Wood Plank Exterior Walls
- Crimped Sheet Metal Panels over Wooden, A-framed Roof
- Wood Floor Substrate attached to Wood Joists
 - Multiple Sheet Flooring Layers
 - Asbestos-containing Layers in Room D
 - Tacked Carpet Layers
- Wood-framed Interior Walls

- Asbestos-containing Sheetrock Sections attached to Wood Framing
- Fiberboard Panels attached to Wood Framing
- Wood Paneling over Fiberboard Panels and Wood Framing
- Wood Ceiling Joists
 - Asbestos-containing Sheetrock Sections attached to Joists
 - Spray-applied and Stippled Texture over Some Sections
 - Painted Wood Slats attached to Joists
- Climate Control Equipment
 - Former Brick Chimney, covered by Interior Wall Materials, Does Not Penetrate the Sheet Metal Roof
 - Metal Vent Pipe Observed at Roof; however, No Interior Attachment

Future use of the property, following demolition activities, is unknown.

The survey included a visual inspection to identify the presence of materials suspected of containing asbestos. This identification was based on the experience and training of the inspector. A total of fifty-three (53) samples were collected during the survey for laboratory analysis, based upon the required EPA and South Carolina Department of Environmental Services (SCDES) sampling matrix. Samples were placed in individual containers, labeled and numbered according to the sampling scheme (548-1 through 548-53). Per SCDES Asbestos Regulations, the independent laboratory is required to analyze all layers of each sample. As a result of some sample materials containing multiple layers that were identified by the laboratory (e.g. sheetrock with joint compound and multi-layered flooring materials), sixty (60) samples were analyzed by the lab, via Polarized Light Microscopy (PLM) while utilizing Positive Stop, and eighteen (18) samples were analyzed, via Transmission Electron Microscopy (TEM). Appendix B

contains the Asbestos Survey Log kept during the inspection which identifies the samples collected by sample number, sample type, location and condition assessment, along with any comments. The samples were shipped to EMSL Analytical, Inc. in Kernersville, North Carolina for analysis. Analysis and results are discussed in Section 4.0.

3.0 HAZARD ASSESSMENT FACTORS (ASBESTOS)

3.1 Homogeneous Areas

The sample collection was typically conducted by homogeneous materials, i.e., any materials of the same type regarding uniformity throughout in structure or make-up and appearance (color, texture, and/or date of construction/application). Homogeneous materials can be further classified as surfacing materials, thermal system insulation and miscellaneous materials. Miscellaneous materials include ceiling tiles, floor tiles, roofing, caulking, and glazing, etc.

3.2 Hazard Factors

The samples of suspect material collected were classified as either friable (F) or non-friable (NF). Friable means the material can be crumbled, pulverized, or reduced to powder by ordinary hand pressure. Materials initially determined to be non-friable can receive a reclassification of friable if the material is damaged, thereby providing an avenue for release of asbestos fibers. Friable asbestos-containing material (ACM) has been determined by EPA and OSHA to be a greater hazard (health risk) than non-friable ACM. In assessing the fiber release potential, the current condition of the suspect materials sampled was noted in the Asbestos Survey Log (Appendix B). The condition was denoted as good, damaged, or significantly damaged. Current condition is a factor used to assess the potential for fiber release. Other factors used to determine potential fiber release include air movement, surface type, and area activity as related to human

occupancy.

4.0 ANALYSIS AND RESULTS

4.1 Laboratory Analysis

Samples were analyzed by EMSL Analytical, Inc. using Polarized Light Microscopy (PLM) with Dispersion Staining Techniques (EPA Bulk Analysis Method 600/R-93/116). This method utilizes part of the bulk sample which is mounted on a slide and exposed to an oil of specific refractive index. This prepared slide is then subjected to a variety of optical tests.

Each type of asbestos displays unique characteristics when subjected to these tests. Percentages of asbestos content are then determined through visual estimating. Although this is an estimate, any material containing greater than one percent of any type of asbestos is classified as ACM by the EPA. Any material classified as ACM must be handled accordingly.

Under the revised South Carolina Asbestos Regulation 61-86.1 effective June 27, 2008, any analysis of non-friable organically bound (NOB) material that is found to be negative via PLM testing, must have confirmation testing via Transmission Electron Microscopy (TEM) on one sample from each medium; therefore, eighteen (18) samples were analyzed by the lab, via TEM testing.

4.2 Survey Results

Samples were collected and tested from various suspect materials, as referenced in Appendix B, Asbestos Sample Log. Samples of Room B carpet, Room A sheet flooring, Room C carpet layers, Room E sheet flooring, Room H sheet flooring, Room F sheet flooring layers, Room G sheet flooring layers, and interior/exterior window caulking were verified as negative, via TEM analysis.

- Asbestos was detected at less than one percent (<1%) in the stippled ceiling texture in Room H, via PLM analysis.

The South Carolina Department of Environmental Services (SCDES) and the Environmental Protection Agency (EPA) define “Asbestos-containing Material (ACM)” as material containing asbestos of any type, either alone or mixed with other materials, **in an amount greater than one percent (>1%)** as determined by using the method specified in 40 CFR Part 763, Appendix A, Subpart F, Section 1, as amended, or an accepted equivalent. Of note, the Occupational Safety and Health Administration (OSHA) has no such threshold and considers a material with any amount of asbestos as asbestos-containing material.

Appendix C contains a copy of the analytical results from the laboratory.

TABLE 1
DILAPIDATED RESIDENTIAL STRUCTURE
548 SOUTH MAIN STREET
SUMTER, SOUTH CAROLINA
ASBESTOS-CONTAINING MATERIAL (ACM) AND
REGULATED ASBESTOS-CONTAINING MATERIAL (RACM)

Description	Location	Category (F/NF)	Approx. SF/LF
Orange/Black and Tan Sheet Flooring Layers of Room D	Over Wood Floor Substrate in Room D ⁽¹⁾	NF – Cat. I – Good Condition	144 SF
Sheetrock with Joint Compound Wall and Ceiling System	Interior Rooms with Sheetrock-system Ceiling and Wall Components ⁽²⁾	F – Significantly Damaged Condition	1,450 SF

Note: F - Friable

NF - Non-Friable

(1) - At least six layers of sheet flooring are on the floor of Room D, with asbestos-containing layers being inseparable from layers with no asbestos detected

(2) - Abatement contractor should identify sections of walls and ceilings covered with the sheetrock with joint compound system, including ceiling areas surfaced with textured materials.

EMERALD, INC., CONDUCTED THE SURVEY TO THE BEST OF ITS ABILITY, ADHERING TO INDUSTRY STANDARDS. THE QUANTITIES PROVIDED IN THIS REPORT ARE APPROXIMATE AND SHALL SERVE AS A BASIS FOR ABATEMENT BID SUBMITTALS. IF ADDITIONAL SUSPECT MATERIALS ARE IDENTIFIED DURING RENOVATION OR DEMOLITION ACTIVITY, THE CONTRACTOR SHALL CEASE WORK AND NOTIFY THE BUILDING OWNER'S REPRESENTATIVE.

5.0 CONCLUSIONS AND RECOMMENDATIONS

Based upon the inspection of October 20, 2025, and the analytical results from the samples collected and tested by an independent laboratory, the dilapidated residential structure located at 548 S. Main St. in Sumter, S.C., does contain friable RACM and non-friable ACM, as per Table 1. Such materials will have to be removed and properly disposed of by a S.C. licensed abatement contractor per SCDES Bureau of Air Quality Asbestos Regulation 61-86.1 effective May 27, 2011, prior to demolition activities involving the asbestos-containing materials.

Whereas the residential structure is in dilapidated condition, and the significantly damaged sheetrock system is asbestos-containing, Emerald, Inc., concludes that the entire structure, with approximately 3,800 cubic feet of building materials, is contaminated with regulated asbestos-containing materials (RACM). It is recommended that a licensed codes enforcement officer representing the City or County of Sumter, or a professional engineer, inspect the structure and, subsequently, generate an official letter that states the dilapidated conditions, to facilitate SCDES licensing requirements regarding outdoor demolition activities with regulated asbestos-containing materials.

6.0 ASSUMPTIONS AND LIMITATIONS

The results, findings, conclusions and recommendations expressed in this report are based only on conditions that were observed during the inspection of October 20, 2025. Emerald, Inc., their representative and this report make no representation and/or assumptions as to past conditions or future occurrences. The information, conclusions and recommendations provided herein do not constitute as legal or medical advice. It is further understood that Emerald, Inc. makes no representations or warranties of any kind. Nor are such representations or warranties to be implied with respect to the data furnished. Emerald, Inc. assumes no responsibility with respect to the customers and its employees use thereof.

The information provided herein applies only to the subject property as it existed during Emerald, Inc.'s site visit. If this site's use and/or conditions change, information, observations and recommendations found herein would no longer apply. This report is intended to be used in its entirety. No excerpts may be taken to typify the findings of this survey. Emerald, Inc. shall not be liable for any special, consequential and/or exemplary damages resulting, in whole or in part, from the customer's use of the data provided. It was not within the scope of this investigation to remove surface materials to investigate portions of the structure or materials that lay beneath the surface. Our selection of sample locations and frequency is based upon our observations and the assumption that like materials in the same are homogeneous.

Emerald, Inc. conducted the survey to the best of its ability using the standards of the industry. In the event additional materials are found to contain asbestos, Emerald, Inc. shall not be liable for any failure of such findings during its initial survey.

EMSL maintains liability limited to cost of analysis. Interpretation and use of test results are the responsibility of the client. This report relates only to the samples reported above, and may not be reproduced, except in full, without written approval by EMSL. EMSL bears no responsibility for sample collection activities or analytical method limitations. The report reflects the samples as received. Results are generated from the field sampling data (sampling volumes and areas, locations, etc.) provided by the client on the Chain of Custody. Samples are within quality control criteria and met method specifications unless otherwise noted. The above analyses were performed in general compliance with Appendix E to Subpart E of 40 CFR (previously EPA 600/M4-82-020 "Interim Method") but augmented with procedures outlined in the 1993 ("final") version of the method. This report must not be used by the client to claim product certification, approval, or endorsement by NVLAP, NIST or any agency of the federal government. Non-friable organically bound materials present a problem matrix and therefore EMSL recommends gravimetric reduction prior to analysis. Unless requested by the client, building materials manufactured with multiple layers (i.e. linoleum, wallboard, etc.) are reported as a single sample. Estimation of uncertainty is available on request.

Samples analyzed by EMSL Analytical, Inc. Kernersville, NC NVLAP Lab Code 102104-0, Virginia 3333-000228, West Virginia LT000321

Re: 548 S. Main St.

Parcel # 227-05-05-025

The structure identified above is structurally compromised and unsafe to enter.

The asbestos will need to be abated through demolition.

Respectfully,

Woody Avins

Building Official

FOREWORD

This report was prepared by Emerald, Inc., of Sumter, South Carolina, for the City of Sumter, regarding the dilapidated residential building located at 724 Olive St. in Sumter, S.C. The contents of this report are confidential and intended for the use of the client only.

J. Dalton Reames, Jr., S.C. Licensed Building Inspector, conducted the inspection, and Ronny L. Lowder, S.C. Licensed Building Inspector and Management Planner, prepared this report. Any questions or comments concerning this report should be directed to Ronny L. Lowder at either (803) 469-5454 or via email at rlowder@emeraldinc-us.com.

1.0 INTRODUCTION AND OBJECTIVE

Emerald, Inc. was requested to conduct an Asbestos Survey of the vacant residential structure located at 724 Olive St. in Sumter, S.C., to identify the presence of any asbestos-containing materials (ACM), prior to demolition activities. The inspection was authorized by Mr. John Macloskie, Codes Director, with the City of Sumter. The inspection included identification and assessment of the condition of suspect asbestos-containing materials, either friable or non-friable, on the interior and exterior portions of the structure.

This report is a compilation of the inspection and its results.

2.0 SURVEY METHODOLOGY

On March 20, 2025, Emerald, Inc. conducted an Asbestos Survey on the residential building at the stated address. J. Dalton Reames, Jr., South Carolina Licensed Building Inspector, conducted the inspection.

Constructed circa 1953, the single-story residential structure, built over an earthen crawl space, contains approximately 820 square feet of interior space. The basic building construction is as follows:

- Exterior Walls
 - Aluminum and Vinyl Cladding over Wood Planks
 - Wood Planks attached to Wood Framework
- Wooden A-framed Roof Structure
 - Covered with Shingles and Felt Paper
- Hardwood Flooring Substrate
 - Several Types of Resilient Sheet Flooring over Wood Substrate
- Interior Walls

- Wood Paneling over Sheetrock System
 - Sheetrock attached to Wood Framework
- Sheetrock Ceiling System attached to Wooden Joists
 - Spray-applied Texture in Room A
- Climate Control Equipment
 - Two Chimney Units

Future use of the property, following demolition activities, is unknown.

The survey included a visual inspection to identify the presence of material suspected of containing asbestos. This identification was based on the experience and training of the inspector. A total of forty-one (41) samples were collected during the survey for laboratory analysis, based upon the required EPA and South Carolina Department of Environmental Services (SCDES) sampling matrix. Samples were placed in individual containers, labeled and numbered according to the sampling schemes (724-1 through 724-41). Per SCDES Asbestos Regulations, the independent laboratory is required to sample all layers of each sample. As a result, thirty-seven (37) samples were analyzed by the lab, via Polarized Light Microscopy (PLM) while utilizing Positive Stop, and eight (8) samples were analyzed, via Transmission Electron Microscopy (TEM). Appendix B contains the Asbestos Survey Log kept during the inspection which identifies the samples collected by sample number, sample type, location and condition assessment, along with any comments. The samples were shipped to EMSL Analytical, Inc. in Kernersville, North Carolina for analysis. Analysis and results are discussed in Section 4.0.

3.0 HAZARD ASSESSMENT FACTORS (ASBESTOS)

3.1 Homogeneous Areas

The sample collection was typically conducted by homogeneous materials, i.e., any materials of the same type regarding uniformity throughout in structure or make-up and appearance (color, texture, and/or date of construction/application). Homogeneous materials can be further classified as surfacing materials, thermal system insulation and miscellaneous materials. Miscellaneous materials include ceiling tiles, floor tiles, roofing, caulking, and glazing, etc.

3.2 Hazard Factors

The samples of suspect material collected were classified as either friable (F) or non-friable (NF). Friable means the material can be crumbled, pulverized, or reduced to powder by ordinary hand pressure. Materials initially determined to be non-friable can receive a reclassification of friable if the material is damaged, thereby providing an avenue for release of asbestos fibers. Friable asbestos-containing material (ACM) has been determined by EPA and OSHA to be a greater hazard (health risk) than non-friable ACM. In assessing the fiber release potential, the current condition of the suspect materials sampled was noted in the Asbestos Survey Log (Appendix B). The condition was denoted as good, damaged, or significantly damaged. Current condition is a factor used to assess the potential for fiber release. Other factors used to determine potential fiber release include air movement, surface type, and area activity as related to human occupancy.

4.0 ANALYSIS AND RESULTS

4.1 Laboratory Analysis

Bulk samples were analyzed by EMSL Analytical, Inc. using Polarized Light Microscopy (PLM) with Dispersion Staining Techniques (EPA Bulk Analysis Method 600/R-93/116). This method utilizes part of the bulk sample which is mounted on a slide and exposed to an oil of specific refractive index. This prepared slide is then subjected to a variety of optical tests.

Each type of asbestos displays unique characteristics when subjected to these tests. Percentages of asbestos content are then determined through visual estimating. Although this is an estimate, any material containing greater than one percent of any type of asbestos is classified as ACM by the EPA. Any material classified as ACM must be handled accordingly.

Under the revised South Carolina Asbestos Regulation 61-86.1 effective June 27, 2008, any analysis of non-friable organically bound (NOB) material that is found to be negative via PLM testing, must have confirmation testing via Transmission Electron Microscopy (TEM) on one sample from each media; therefore, eight (8) samples were analyzed by the lab, via TEM testing.

4.2 Survey Results

Samples were collected and tested from various suspect materials, as referenced in Appendix B, Asbestos Sample Log. Samples of roof shingles, roofing felt, window glaze, Room A sheet flooring and felt, tan stylized sheet flooring, brown-square sheet flooring, and brown stylized sheet flooring were verified as negative, via TEM analysis.

Appendix C contains a copy of the analytical results from the laboratory.
of the analytical results from the laboratory.

**TABLE 1
DILAPIDATED RESIDENTIAL BUILDING
724 OLIVE STREET
SUMTER, SOUTH CAROLINA
ASBESTOS-CONTAINING MATERIALS (ACM)**

Description	Location	Category (F/NF)	Approx. SF/LF
Chimney Flashing Sealant Material	At Roof Junction of Two Chimney Units	NF – Cat. I – Good Condition	24 LF
Yellowish Tan, Geometric-designed Sheet Flooring	Base Layer of Sheet Flooring in Room F (Under Stylized Layer)	NF – Cat. I – Good Condition	64 SF

Note: F - Friable
NF - Non-Friable

EMERALD, INC., CONDUCTED THE SURVEY TO THE BEST OF ITS ABILITY, ADHERING TO INDUSTRY STANDARDS. THE QUANTITIES PROVIDED IN THIS REPORT ARE APPROXIMATE AND SHALL SERVE AS A BASIS FOR ABATEMENT BID SUBMITTALS. IF ADDITIONAL SUSPECT MATERIALS ARE IDENTIFIED DURING RENOVATION OR DEMOLITION ACTIVITY, THE CONTRACTOR SHALL CEASE WORK AND NOTIFY THE BUILDING OWNER'S REPRESENTATIVE.

5.0 CONCLUSIONS AND RECOMMENDATIONS

Based upon the inspection of March 20, 2025, and the analytical results from the samples collected and tested by an independent laboratory, the dilapidated residential building located at 724 Olive St. in Sumter, S.C., does contain non-friable ACM, as per Table 1. Such materials will have to be removed and properly disposed of by a S.C. licensed abatement contractor per SCDES Bureau of Air Quality Asbestos Regulation 61-86.1 effective May 27, 2011, prior to demolition activities involving the asbestos-containing materials.

6.0 ASSUMPTIONS AND LIMITATIONS

The results, findings, conclusions and recommendations expressed in this report are based only on conditions that were observed during the inspection of March 20, 2025. Emerald, Inc., their representative and this report make no representation and/or assumptions as to past conditions or future occurrences. The information, conclusions and recommendations provided herein do not constitute as legal or medical advice. It is further understood that Emerald, Inc. makes no representations or warranties of any kind. Nor are such representations or warranties to be implied with respect to the data furnished. Emerald, Inc. assumes no responsibility with respect to the customers and its employees use thereof.

The information provided herein applies only to the subject property as it existed during Emerald, Inc.'s site visit. If this site's use and/or conditions change, information, observations and recommendations found herein would no longer apply. This report is intended to be used in its entirety. No excerpts may be taken to typify the findings of this survey. Emerald, Inc. shall not be liable for any special, consequential and/or exemplary damages resulting, in whole or in part, from the customer's use of the data provided. It was not within the scope of this investigation to remove surface materials to investigate portions of the structure or materials that lay beneath the surface. Our selection of sample locations and frequency is based upon our observations and the assumption that like materials in the same are homogeneous.

Emerald, Inc. conducted the survey to the best of its ability using the standards of the industry. In the event additional materials are found to contain asbestos, Emerald, Inc. shall not be liable for any failure of such findings during its initial survey.

EMSL maintains liability limited to cost of analysis. Interpretation and use of test results are the responsibility of the client. This report relates only to the samples reported above, and may not be reproduced, except in full, without written approval by EMSL. EMSL bears no responsibility for sample collection activities or analytical method limitations. The report reflects the samples as received. Results are generated from the field sampling data (sampling volumes and areas, locations, etc.) provided by the client on the Chain of Custody. Samples are within quality control criteria and met method specifications unless otherwise noted. The above analyses were performed in general compliance with Appendix E to Subpart E of 40 CFR (previously EPA 600/M4-82-020 "Interim Method") but augmented with procedures outlined in the 1993 ("final") version of the method. This report must not be used by the client to claim product certification, approval, or endorsement by NVLAP, NIST or any agency of the federal government. Non-friable organically bound materials present a problem matrix and therefore EMSL recommends gravimetric reduction prior to analysis. Unless requested by the client, building materials manufactured with multiple layers (i.e. linoleum, wallboard, etc.) are reported as a single sample. Estimation of uncertainty is available on request.

Samples analyzed by EMSL Analytical, Inc. Kenersville, NC NVLAP Lab Code 102104-0, Virginia 3333-000228, West Virginia LT000321

1.0 INTRODUCTION AND OBJECTIVE

Emerald, Inc. was requested to conduct an Asbestos Survey of the vacant mobile home unit located at 816 Nevada Ct. in Sumter, S.C., to identify the presence of any asbestos-containing materials (ACM), prior to demolition activities. The inspection was authorized by Mr. John Macloskie, Codes Director, with the City of Sumter. The inspection included identification and assessment of the condition of suspect asbestos-containing materials, either friable or non-friable, on the interior and exterior portions of the structure.

This report is a compilation of the inspection and its results.

2.0 SURVEY METHODOLOGY

On October 22, 2025, Emerald, Inc. conducted an Asbestos Survey of the building at the stated location. J. Dalton Reames, Jr., South Carolina Licensed Building Inspector, conducted the inspection.

Staged on the property circa 1995 for residential purposes, the single-story mobile home structure contains approximately 804 square feet of interior space. Wood-framed walls are attached to a metal trailer frame, which is supported by concrete block pilings. The basic building materials of the unit are as follows:

- Sheet metal exterior wall panels attached to wood framework
- Metal roof sections attached to wood framework
- Wood floor substrate attached to metal trailer frame
 - Resilient sheet flooring
 - Tacked carpet
- Gypsum-based interior walls with furring strips covering the seams
- Gypsum-based ceiling panels with simulated texture surface
- Interior furnace unit with floor-mounted metal ductwork

Future use of the property, following demolition activities, is unknown.

The survey included a visual inspection to identify the presence of materials suspected of containing asbestos. This identification was based on the experience and training of the inspector. A total of twenty-one (21) samples were collected during the survey for laboratory analysis, based upon the required EPA and South Carolina Department of Environmental Services (SCDES) sampling matrix. Samples were placed in individual containers, labeled and numbered according to the sampling scheme (816-1 through 816-21). Per SCDES Asbestos Regulations, the independent laboratory is required to analyze all layers of each sample. As a result of some sample materials containing multiple layers that were identified by the laboratory (e.g. gypsum ceiling panels with texture) eighteen (18) samples were analyzed by the lab, via Polarized Light Microscopy (PLM) while utilizing Positive Stop, and four (4) samples were analyzed, via Transmission Electron Microscopy (TEM). Appendix B contains the Asbestos Survey Log kept during the inspection which identifies the samples collected by sample number, sample type, location and condition assessment, along with any comments. The samples were shipped to EMSL Analytical, Inc. in Kernersville, North Carolina for analysis. Analysis and results are discussed in Section 4.0.

3.0 HAZARD ASSESSMENT FACTORS (ASBESTOS)

3.1 Homogeneous Areas

The sample collection was typically conducted by homogeneous materials, i.e., any materials of the same type regarding uniformity throughout in structure or make-up and appearance (color, texture, and/or date of construction/application). Homogeneous materials can be further classified as surfacing materials, thermal system insulation and miscellaneous materials. Miscellaneous materials include ceiling tiles, floor tiles, roofing,

caulking, and glazing, etc.

3.2 Hazard Factors

The samples of suspect material collected were classified as either friable (F) or non-friable (NF). Friable means the material can be crumbled, pulverized, or reduced to powder by ordinary hand pressure. Materials initially determined to be non-friable can receive a reclassification of friable if the material is damaged, thereby providing an avenue for release of asbestos fibers. Friable asbestos-containing material (ACM) has been determined by EPA and OSHA to be a greater hazard (health risk) than non-friable ACM. In assessing the fiber release potential, the current condition of the suspect materials sampled was noted in the Asbestos Survey Log (Appendix B). The condition was denoted as good, damaged, or significantly damaged. Current condition is a factor used to assess the potential for fiber release. Other factors used to determine potential fiber release include air movement, surface type, and area activity as related to human occupancy.

4.0 ANALYSIS AND RESULTS

4.1 Laboratory Analysis

Samples were analyzed by EMSL Analytical, Inc. using Polarized Light Microscopy (PLM) with Dispersion Staining Techniques (EPA Bulk Analysis Method 600/R-93/116). This method utilizes part of the bulk sample which is mounted on a slide and exposed to an oil of specific refractive index. This prepared slide is then subjected to a variety of optical tests.

Each type of asbestos displays unique characteristics when subjected to these tests. Percentages of asbestos content are then determined through visual estimating. Although this is an estimate, any material containing greater than one percent of any type

of asbestos is classified as ACM by the EPA. Any material classified as ACM must be handled accordingly.

Under the revised South Carolina Asbestos Regulation 61-86.1 effective June 27, 2008, any analysis of non-friable organically bound (NOB) material that is found to be negative via PLM testing, must have confirmation testing via Transmission Electron Microscopy (TEM) on one sample from each medium; therefore, four (4) samples were analyzed by the lab, via TEM testing.

4.2 Survey Results

Samples were collected and tested from various suspect materials, as referenced in Appendix B, Asbestos Sample Log. Samples of roof surface sealant, roof flashing and seam sealant, tan sheet flooring, and carpet backing were verified as negative, via TEM analysis.

Appendix C contains a copy of the analytical results from the laboratory.

EMERALD, INC., CONDUCTED THE SURVEY TO THE BEST OF ITS ABILITY, ADHERING TO INDUSTRY STANDARDS. THE QUANTITIES PROVIDED IN THIS REPORT ARE APPROXIMATE AND SHALL SERVE AS A BASIS FOR ABATEMENT BID SUBMITTALS. IF ADDITIONAL SUSPECT MATERIALS ARE IDENTIFIED DURING RENOVATION OR DEMOLITION ACTIVITY, THE CONTRACTOR SHALL CEASE WORK AND NOTIFY THE BUILDING OWNER'S REPRESENTATIVE.

5.0 CONCLUSIONS AND RECOMMENDATIONS

Based upon the inspection of October 22, 2025, and the analytical results from the samples collected and tested by an independent laboratory, the dilapidated mobile home unit located at 816 Nevada Ct. in Sumter, S.C., does contain non-friable ACM, as per Table 1. Such materials will have to be removed and properly disposed of by a S.C. licensed abatement contractor per SCDES Bureau of Air Quality Asbestos Regulation 61-86.1 effective May 27, 2011, prior to demolition activities involving the asbestos-containing materials.

While some interior building materials were in dilapidated condition, the exterior walls and window frames were accessible, with young-growth trees and vines acting as the only impediments, at the time of the survey.

6.0 ASSUMPTIONS AND LIMITATIONS

The results, findings, conclusions and recommendations expressed in this report are based only on conditions that were observed during the inspection of October 22, 2025. Emerald, Inc., their representative and this report make no representation and/or assumptions as to past conditions or future occurrences. The information, conclusions and recommendations provided herein do not constitute as legal or medical advice. It is further understood that Emerald, Inc. makes no representations or warranties of any kind. Nor are such representations or warranties to be implied with respect to the data furnished. Emerald, Inc. assumes no responsibility with respect to the customers and its employees use thereof.

The information provided herein applies only to the subject property as it existed during Emerald, Inc.'s site visit. If this site's use and/or conditions change, information, observations and recommendations found herein would no longer apply. This report is intended to be used in its entirety. No excerpts may be taken to typify the findings of this survey. Emerald, Inc. shall not be liable for any special, consequential and/or exemplary damages resulting, in whole or in part, from the customer's use of the data provided. It was not within the scope of this investigation to remove surface materials to investigate portions of the structure or materials that lay beneath the surface. Our selection of sample locations and frequency is based upon our observations and the assumption that like materials in the same are homogeneous.

Emerald, Inc. conducted the survey to the best of its ability using the standards of the industry. In the event additional materials are found to contain asbestos, Emerald, Inc. shall not be liable for any failure of such findings during its initial survey.

EMSL maintains liability limited to cost of analysis. Interpretation and use of test results are the responsibility of the client. This report relates only to the samples reported above, and may not be reproduced, except in full, without written approval by EMSL. EMSL bears no responsibility for sample collection activities or analytical method limitations. The report reflects the samples as received. Results are generated from the field sampling data (sampling volumes and areas, locations, etc.) provided by the client on the Chain of Custody. Samples are within quality control criteria and met method specifications unless otherwise noted. EMSL recommends that samples reported as none detected or <1% undergo additional analysis via PLM to avoid the possibility of false negatives.

EMSL maintains liability limited to cost of analysis. Interpretation and use of test results are the responsibility of the client. This report relates only to the samples reported above, and may not be reproduced, except in full, without written approval by EMSL. EMSL bears no responsibility for sample collection activities or analytical method limitations. The report reflects the samples as received. Results are generated from the field sampling data (sampling volumes and areas, locations, etc.) provided by the client on the Chain of Custody. Samples are within quality control criteria and met method specifications unless otherwise noted. The above analyses were performed in general compliance with Appendix E to Subpart E of 40 CFR (previously EPA 600/M4-82-020 "Interim Method") but augmented with procedures outlined in the 1993 ("final") version of the method. This report must not be used by the client to claim product certification, approval, or endorsement by NVLAP, NIST or any agency of the federal government. Non-friable organically bound materials present a problem matrix and therefore EMSL recommends gravimetric reduction prior to analysis. Unless requested by the client, building materials manufactured with multiple layers (i.e. linoleum, wallboard, etc.) are reported as a single sample. Estimation of uncertainty is available on request.

FOREWORD

This report was prepared by Emerald, Inc., of Sumter, South Carolina, for the City of Sumter, regarding the dilapidated mobile home unit located at 830 Webb St. in Sumter, S.C. The contents of this report are confidential and intended for the use of the client only.

J. Dalton Reames, Jr., S.C. Licensed Building Inspector, conducted the inspection, and Ronny L. Lowder, S.C. Licensed Building Inspector and Management Planner, prepared this report. Any questions or comments concerning this report should be directed to Ronny L. Lowder at either (803) 469-5454 or via email at rlowder@emeraldinc-us.com.

1.0 INTRODUCTION AND OBJECTIVE

Emerald, Inc., was requested to conduct an Asbestos Survey of the vacant mobile home structure located at 830 Webb St. in Sumter, S.C., to identify the presence of any asbestos-containing materials (ACM), prior to demolition activities. The inspection was authorized by Mr. John Macloskie, Codes Director, with the City of Sumter. The inspection included identification and assessment of the condition of suspect asbestos-containing materials, either friable or non-friable, on the interior and exterior portions of the structure.

This report is a compilation of the inspection and its results.

2.0 SURVEY METHODOLOGY

On February 25, 2025, Emerald, Inc. conducted an Asbestos Survey on the residential building at the stated address. J. Dalton Reames, Jr., South Carolina Licensed Building Inspector, conducted the inspection.

Staged on the property circa 1990 for residential purposes, the single-story mobile home structure contains approximately 840 square feet of interior space. The basic building construction is as follows:

- Wood Framing attached to Metal Trailer Frame
- Metal Roof attached to Wooden Framework
 - **Asbestos-containing Silver Sealant Material**
- Metal Exterior Wall Sections attached to Wooden Framework
- Plywood and Particle Board Floor Substrates
 - Various Types of Resilient Flooring Layers
 - Carpet tacked to Wooden Strips
- Interior Walls
 - Wood Paneling attached to Wooden Framework

- Brick-designed Fiberboard Panels over Wood Panels
- Cellulose-based Ceiling Panels attached to Wooden Framework
- Climate Control Equipment
 - Ground-mounted HVAC Compressor
 - Foil-wrapped, Fiberglass-insulated Ductwork
 - Staged in Crawl Space Area and attached to Floor Vents

Future use of the property, following demolition activities, is unknown.

The survey included a visual inspection to identify the presence of material suspected of containing asbestos. This identification was based on the experience and training of the inspector. A total of forty-two (42) samples were collected during the survey for laboratory analysis, based upon the required EPA and South Carolina Department of Environmental Services (SCDES) sampling matrix. Samples were placed in individual containers, labeled and numbered according to the sampling schemes (830-1 through 830-42). Per SCDES Asbestos Regulations, the independent laboratory is required to sample all layers of each sample. As a result, thirty-eight (38) samples were analyzed by the lab, via Polarized Light Microscopy (PLM) while utilizing Positive Stop, and ten (10) samples were analyzed, via Transmission Electron Microscopy (TEM). Appendix B contains the Asbestos Survey Log kept during the inspection which identifies the samples collected by sample number, sample type, location and condition assessment, along with any comments. The samples were shipped to EMSL Analytical, Inc. in Kernersville, North Carolina for analysis. Analysis and results are discussed in Section 4.0.

3.0 HAZARD ASSESSMENT FACTORS (ASBESTOS)

3.1 Homogeneous Areas

The sample collection was typically conducted by homogeneous materials, i.e., any materials of the same type regarding uniformity throughout in structure or make-up and appearance (color, texture, and/or date of construction/application). Homogeneous materials can be further classified as surfacing materials, thermal system insulation and miscellaneous materials. Miscellaneous materials include ceiling tiles, floor tiles, roofing, caulking, and glazing, etc.

3.2 Hazard Factors

The samples of suspect material collected were classified as either friable (F) or non-friable (NF). Friable means the material can be crumbled, pulverized, or reduced to powder by ordinary hand pressure. Materials initially determined to be non-friable can receive a reclassification of friable if the material is damaged, thereby providing an avenue for release of asbestos fibers. Friable asbestos-containing material (ACM) has been determined by EPA and OSHA to be a greater hazard (health risk) than non-friable ACM. In assessing the fiber release potential, the current condition of the suspect materials sampled was noted in the Asbestos Survey Log (Appendix B). The condition was denoted as good, damaged, or significantly damaged. Current condition is a factor used to assess the potential for fiber release. Other factors used to determine potential fiber release include air movement, surface type, and area activity as related to human occupancy.

4.0 ANALYSIS AND RESULTS

4.1 Laboratory Analysis

Bulk samples were analyzed by EMSL Analytical, Inc. using Polarized Light Microscopy (PLM) with Dispersion Staining Techniques (EPA Bulk Analysis Method 600/R-93/116). This method utilizes part of the bulk sample which is mounted on a slide and exposed to an oil of specific refractive index. This prepared slide is then subjected to a variety of optical tests.

Each type of asbestos displays unique characteristics when subjected to these tests. Percentages of asbestos content are then determined through visual estimating. Although this is an estimate, any material containing greater than one percent of any type of asbestos is classified as ACM by the EPA. Any material classified as ACM must be handled accordingly.

Under the revised South Carolina Asbestos Regulation 61-86.1 effective June 27, 2008, any analysis of non-friable organically bound (NOB) material that is found to be negative via PLM testing, must have confirmation testing via Transmission Electron Microscopy (TEM) on one sample from each media; therefore, ten (10) samples were analyzed by the lab, via TEM testing.

4.2 Survey Results

Samples were collected and tested from various suspect materials, as referenced in Appendix B, Asbestos Sample Log. Samples of window/door frame caulk, clear caulk, carpet backing, tan sheet flooring, wood-design sheet flooring, rough-textured sheet flooring and brick-designed sheet flooring were verified as negative, via TEM analysis.

Appendix C contains a copy of the analytical results from the laboratory.
of the analytical results from the laboratory.

5.0 CONCLUSIONS AND RECOMMENDATIONS

Based upon the inspection of February 25, 2025, and the analytical results from the samples collected and tested by an independent laboratory, the dilapidated mobile home building located at 830 Webb St. in Sumter, S.C., does contain non-friable ACM, as per Table 1. Such materials will have to be removed and properly disposed of by a S.C. licensed abatement contractor per SCDES Bureau of Air Quality Asbestos Regulation 61-86.1 effective May 27, 2011, prior to demolition activities involving the asbestos-containing materials.

6.0 ASSUMPTIONS AND LIMITATIONS

The results, findings, conclusions and recommendations expressed in this report are based only on conditions that were observed during the inspection of February 25, 2025. Emerald, Inc., their representative and this report make no representation and/or assumptions as to past conditions or future occurrences. The information, conclusions and recommendations provided herein do not constitute as legal or medical advice. It is further understood that Emerald, Inc. makes no representations or warranties of any kind. Nor are such representations or warranties to be implied with respect to the data furnished. Emerald, Inc. assumes no responsibility with respect to the customers and its employees use thereof.

The information provided herein applies only to the subject property as it existed during Emerald, Inc.'s site visit. If this site's use and/or conditions change, information, observations and recommendations found herein would no longer apply. This report is intended to be used in its entirety. No excerpts may be taken to typify the findings of this survey. Emerald, Inc. shall not be liable for any special, consequential and/or exemplary damages resulting, in whole or in part, from the customer's use of the data provided. It was not within the scope of this investigation to remove surface materials to investigate portions of the structure or materials that lay beneath the surface. Our selection of sample locations and frequency is based upon our observations and the assumption that like materials in the same are homogeneous.

Emerald, Inc. conducted the survey to the best of its ability using the standards of the industry. In the event additional materials are found to contain asbestos, Emerald, Inc. shall not be liable for any failure of such findings during its initial survey.

EMSL maintains liability limited to cost of analysis. Interpretation and use of test results are the responsibility of the client. This report relates only to the samples reported above, and may not be reproduced, except in full, without written approval by EMSL. EMSL bears no responsibility for sample collection activities or analytical method limitations. The report reflects the samples as received. Results are generated from the field sampling data (sampling volumes and areas, locations, etc.) provided by the client on the Chain of Custody. Samples are within quality control criteria and met method specifications unless otherwise noted. The above analyses were performed in general compliance with Appendix E to Subpart E of 40 CFR (previously EPA 600/M4-82-020 "Interim Method") but augmented with procedures outlined in the 1993 ("final") version of the method. This report must not be used by the client to claim product certification, approval, or endorsement by NVLAP, NIST or any agency of the federal government. Non-friable organically bound materials present a problem matrix and therefore EMSL recommends gravimetric reduction prior to analysis. Unless requested by the client, building materials manufactured with multiple layers (i.e. linoleum, wallboard, etc.) are reported as a single sample. Estimation of uncertainty is available on request.

Samples analyzed by EMSL Analytical, Inc. Kernersville, NC NVLAP Lab Code 102104-0, Virginia 3333-000228, West Virginia LT000321

FOREWORD

This report was prepared by Emerald, Inc., of Sumter, South Carolina, for the City of Sumter, regarding the dilapidated residential building located at 1551 Illery Rd. in Sumter, S.C. The contents of this report are confidential and intended for the use of the client only.

J. Dalton Reames, Jr., S.C. Licensed Building Inspector, conducted the inspection, and Ronny L. Lowder, S.C. Licensed Building Inspector and Management Planner, prepared this report. Any questions or comments concerning this report should be directed to Ronny L. Lowder at either (803) 469-5454 or via email at rlowder@emeraldinc-us.com.

1.0 INTRODUCTION AND OBJECTIVE

Emerald, Inc. was requested to conduct an Asbestos Survey of the vacant residential structure located at 1551 Illery Rd. in Sumter, S.C., to identify the presence of any asbestos-containing materials (ACM), prior to demolition activities. The inspection was authorized by Mr. John Macloskie, Codes Director, with the City of Sumter. The inspection included identification and assessment of the condition of suspect asbestos-containing materials, either friable or non-friable, on the interior and exterior portions of the structure.

This report is a compilation of the inspection and its results.

2.0 SURVEY METHODOLOGY

On February 24, 2025, Emerald, Inc. conducted an Asbestos Survey on the residential building at the stated address. J. Dalton Reames, Jr., South Carolina Licensed Building Inspector, conducted the inspection.

Constructed circa 1965 for residential purposes, the single-story residential structure, built over an earthen crawl space, contains approximately 770 square feet of interior space. The basic building construction is as follows:

- Brick Veneer Exterior Walls over Wood Framework
- Wooden A-framed Roof Sections in Damaged Condition
 - Covered with Shingles and Felt Paper
- Hardwood Flooring Substrate
 - Resilient Flooring Squares in Room B
- Sheetrock Wall System over Wood Framework
- Sheetrock Ceiling System is covered with Spray-applied Texture
- No Climate-control Equipment Was Present

Future use of the property, following demolition activities, is unknown.

The survey included a visual inspection to identify the presence of material suspected of containing asbestos. This identification was based on the experience and training of the inspector. A total of twenty-nine (29) samples were collected during the survey for laboratory analysis, based upon the required EPA and South Carolina Department of Environmental Services (SCDES) sampling matrix. Samples were placed in individual containers, labeled and numbered according to the sampling schemes (1551-1 through 1551-29). Per SCDES Asbestos Regulations, the independent laboratory is required to sample all layers of each sample. As a result, twenty-six (26) samples were analyzed by the lab, via Polarized Light Microscopy (PLM) while utilizing Positive Stop, and five (5) samples were analyzed, via Transmission Electron Microscopy (TEM). Appendix B contains the Asbestos Survey Log kept during the inspection which identifies the samples collected by sample number, sample type, location and condition assessment, along with any comments. The samples were shipped to EMSL Analytical, Inc. in Kernersville, North Carolina for analysis. Analysis and results are discussed in Section 4.0.

3.0 HAZARD ASSESSMENT FACTORS (ASBESTOS)

3.1 Homogeneous Areas

The sample collection was typically conducted by homogeneous materials, i.e., any materials of the same type regarding uniformity throughout in structure or make-up and appearance (color, texture, and/or date of construction/application). Homogeneous materials can be further classified as surfacing materials, thermal system insulation and miscellaneous materials. Miscellaneous materials include ceiling tiles, floor tiles, roofing, caulking, and glazing, etc.

3.2 Hazard Factors

The samples of suspect material collected were classified as either friable (F) or non-friable (NF). Friable means the material can be crumbled, pulverized, or reduced to powder by ordinary hand pressure. Materials initially determined to be non-friable can receive a reclassification of friable if the material is damaged, thereby providing an avenue for release of asbestos fibers. Friable asbestos-containing material (ACM) has been determined by EPA and OSHA to be a greater hazard (health risk) than non-friable ACM. In assessing the fiber release potential, the current condition of the suspect materials sampled was noted in the Asbestos Survey Log (Appendix B). The condition was denoted as good, damaged, or significantly damaged. Current condition is a factor used to assess the potential for fiber release. Other factors used to determine potential fiber release include air movement, surface type, and area activity as related to human occupancy.

4.0 ANALYSIS AND RESULTS

4.1 Laboratory Analysis

Bulk samples were analyzed by EMSL Analytical, Inc. using Polarized Light Microscopy (PLM) with Dispersion Staining Techniques (EPA Bulk Analysis Method 600/R-93/116). This method utilizes part of the bulk sample which is mounted on a slide and exposed to an oil of specific refractive index. This prepared slide is then subjected to a variety of optical tests.

Each type of asbestos displays unique characteristics when subjected to these tests. Percentages of asbestos content are then determined through visual estimating. Although this is an estimate, any material containing greater than one percent of any type of asbestos is classified as ACM by the EPA. Any material classified as ACM must be handled accordingly.

Under the revised South Carolina Asbestos Regulation 61-86.1 effective June 27, 2008, any analysis of non-friable organically bound (NOB) material that is found to be negative via PLM testing, must have confirmation testing via Transmission Electron Microscopy (TEM) on one sample from each media; therefore, five (5) samples were analyzed by the lab, via TEM testing.

4.2 Survey Results

Samples were collected and tested from various suspect materials, as referenced in Appendix B, Asbestos Sample Log. Samples of roof shingles, roofing felt, flooring squares and flooring felt were verified as negative, via TEM analysis.

Appendix C contains a copy of the analytical results from the laboratory.
of the analytical results from the laboratory.

TABLE 1
DILLAPIDATED RESIDENTIAL BUILDING
1551 ILLERY ROAD
SUMTER, SOUTH CAROLINA
ASBESTOS-CONTAINING MATERIALS (ACM)

Description	Location	Category (F/NF)	Approx. SF/LF
Sheetrock Ceiling and Wall System	Ceilings and Walls throughout the Interior	F – Damaged Condition	3,235 SF
Spray-applied Ceiling Texture	Ceilings of the Residential Structure	F – Damaged Condition	740 SF
Exterior Window Frame Caulk	Window Frame Seams	Cat. II – NF – Good Condition	176 LF

Note: F - Friable
NF - Non-Friable
(1) - Asbestos detected at <0.11% in Window Glaze, via TEM analysis.

EMERALD, INC., CONDUCTED THE SURVEY TO THE BEST OF ITS ABILITY, ADHERING TO INDUSTRY STANDARDS. THE QUANTITIES PROVIDED IN THIS REPORT ARE APPROXIMATE AND SHALL SERVE AS A BASIS FOR ABATEMENT BID SUBMITTALS. IF ADDITIONAL SUSPECT MATERIALS ARE IDENTIFIED DURING RENOVATION OR DEMOLITION ACTIVITY, THE CONTRACTOR SHALL CEASE WORK AND NOTIFY THE BUILDING OWNER'S REPRESENTATIVE.

5.0 CONCLUSIONS AND RECOMMENDATIONS

Based upon the inspection of February 24, 2025, and the analytical results from the samples collected and tested by an independent laboratory, the dilapidated residential building located at 1551 Illery Rd. in Sumter, S.C., does contain friable and non-friable ACM, as per Table 1. Such materials will have to be removed and properly disposed of by a S.C. licensed abatement contractor per SCDES Bureau of Air Quality Asbestos Regulation 61-86.1 effective May 27, 2011, prior to demolition activities involving the asbestos-containing materials.

6.0 ASSUMPTIONS AND LIMITATIONS

The results, findings, conclusions and recommendations expressed in this report are based only on conditions that were observed during the inspection of February 24, 2025. Emerald, Inc., their representative and this report make no representation and/or assumptions as to past conditions or future occurrences. The information, conclusions and recommendations provided herein do not constitute as legal or medical advice. It is further understood that Emerald, Inc. makes no representations or warranties of any kind. Nor are such representations or warranties to be implied with respect to the data furnished. Emerald, Inc. assumes no responsibility with respect to the customers and its employees use thereof.

The information provided herein applies only to the subject property as it existed during Emerald, Inc.'s site visit. If this site's use and/or conditions change, information, observations and recommendations found herein would no longer apply. This report is intended to be used in its entirety. No excerpts may be taken to typify the findings of this survey. Emerald, Inc. shall not be liable for any special, consequential and/or exemplary damages resulting, in whole or in part, from the customer's use of the data provided. It was not within the scope of this investigation to remove surface materials to investigate portions of the structure or materials that lay beneath the surface. Our selection of sample locations and frequency is based upon our observations and the assumption that like materials in the same are homogeneous.

Emerald, Inc. conducted the survey to the best of its ability using the standards of the industry. In the event additional materials are found to contain asbestos, Emerald, Inc. shall not be liable for any failure of such findings during its initial survey.

EMSL maintains liability limited to cost of analysis. Interpretation and use of test results are the responsibility of the client. This report relates only to the samples reported above, and may not be reproduced, except in full, without written approval by EMSL. EMSL bears no responsibility for sample collection activities or analytical method limitations. The report reflects the samples as received. Results are generated from the field sampling data (sampling volumes and areas, locations, etc.) provided by the client on the Chain of Custody. Samples are within quality control criteria and met method specifications unless otherwise noted. EMSL recommends that samples reported as none detected or < 1% undergo additional analysis via PLM to avoid the possibility of false negatives.

EMSL maintains liability limited to cost of analysis. Interpretation and use of test results are the responsibility of the client. This report relates only to the samples reported above, and may not be reproduced, except in full, without written approval by EMSL. EMSL bears no responsibility for sample collection activities or analytical method limitations. The report reflects the samples as received. Results are generated from the field sampling data (sampling volumes and areas, locations, etc.) provided by the client on the Chain of Custody. Samples are within quality control criteria and met method specifications unless otherwise noted. The above analyses were performed in general compliance with Appendix E to Subpart E of 40 CFR (previously EPA 600/M4-82-020 "Interim Method") but augmented with procedures outlined in the 1993 ("final") version of the method. This report must not be used by the client to claim product certification, approval, or endorsement by NVLAP, NIST or any agency of the federal government. Non-friable organically bound materials present a problem matrix and therefore EMSL recommends gravimetric reduction prior to analysis. Unless requested by the client, building materials manufactured with multiple layers (i.e. linoleum, wallboard, etc.) are reported as a single sample. Estimation of uncertainty is available on request.

Samples analyzed by EMSL Analytical, Inc. Kernersville, NC NVLAP Lab Code 102104-0, Virginia 3333-000228, West Virginia LT000321
